

ADS8355

Dual, 16-Bit, 1-MSPS, Simultaneous-Sampling, Analog-to-Digital Converter

1 Features

- 1-MSPS throughput, no latency output
- Simultaneous sampling of two channels
- Supports single-ended and pseudo-differential inputs
- Excellent DC and AC performance:
 - 16-bit NMC DNL, ± 1 -LSB INL
 - 88-dB SNR, -97 -dB THD
- Dual, programmable, 2.5-V internal reference
- Fully-specified over the extended industrial temperature range: -40°C to $+125^{\circ}\text{C}$
- Small footprint: WQFN-16 (3-mm x 3-mm)

2 Applications

- [Servo drive position feedback](#)
- [Optical modules](#)
- [Multifunction relays](#)
- [Power quality analyzers](#)
- [Three phase UPS](#)
- [Analog input modules](#)

3 Description

The ADS8355 is a dual, high-speed, simultaneous-sampling, analog-to-digital converter (ADC) that supports single-ended and pseudo-differential analog inputs.

The device supports a flexible serial interface that can operate over a wide power-supply voltage range. The flexible interface enables easy communication with a large variety of host controllers. Power consumption for a given throughput can be optimized by using the two low-power modes supported by the device. The device is fully specified over the extended industrial temperature range (-40°C to $+125^{\circ}\text{C}$) and is available in a 16-pin WQFN (3-mm x 3-mm) package.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ADS8355	WQFN (16)	3.00 mm x 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

4 Revision History

Changes from Original (February 2020) to Revision A	Page
• Deleted AVDD supply condition and MIN MAX specification for internal reference.	6
• Deleted AVDD supply condition and MIN MAX specification for internal reference.	6

5 Pin Configuration and Functions

Pin Functions

NAME	NO.	TYPE	DESCRIPTION
AINM_A	16	Analog input	Negative analog input, channel A
AINM_B	5	Analog input	Negative analog input, channel B
AINP_A	15	Analog input	Positive analog input, channel A
AINP_B	6	Analog input	Positive analog input, channel B
AVDD	14	Power supply	Supply voltage for ADC operation
$\overline{\text{CS}}$	9	Digital input	Chip-select signal; active low
DVDD	7	Digital I/O supply	Digital I/O supply
GND	13	Power supply	Device ground
REFGND_A	2	Power supply	Reference A ground
REFGND_B	3	Power supply	Reference B ground
REFIO_A	1	Analog input/output	Reference voltage input/output, channel A
REFIO_B	4	Analog input/output	Reference voltage input/output, channel B
SCLK	10	Digital input	Clock for serial communication
SDI	8	Digital input	Data input for serial communication
SDO_A	11	Digital output	Data output A for serial communication, channel A and channel B
SDO_B	12	Digital output	Data output B for serial communication, channel B
Thermal pad		Power supply	Exposed thermal pad. TI recommends connecting this pin to the printed circuit board (PCB) ground.

6 Specifications

6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
AVDD to REFGND_x ⁽²⁾ or GND	-0.3	6	V
DVDD to GND	-0.3	6	V
Analog (AINP_x and AINM_x) ⁽³⁾ and reference input (REFIO_x) voltage with respect to REFGND_x	REFGND_x - 0.3	AVDD + 0.3	V
Digital input voltage with respect to GND	GND - 0.3	DVDD + 0.3	V
REFGND_x	GND - 0.3	GND + 0.3	V
Input current to any pin except supply pins	-10	10	mA
Junction temperature, T _J	-40	125	°C
Storage temperature, T _{stg}	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) REFGND_x refers to REFGND_A and REFGND_B. REFIO_x refers to REFIO_A and REFIO_B.
- (3) AINP_x refers to AINP_A and AINP_B. AINM_x refers to AINM_A and AINM_B.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY						
AVDD	Analog supply voltage (AVDD to AGND)	V _{REF} range, internal reference	4.5	5	5.5	V
		V _{REF} range, external reference V _{REF} < 4.5 V	4.5	5	5.5	
		V _{REF} range, external reference V _{REF} > 4.5 V	V _{REF}	5	5.5	
		2 x V _{REF} range, internal reference	5	5	5.5	
		2 x V _{REF} range, external reference	2 x V _{REF}	5	5.5	
DVDD	Digital supply voltage		1.65	3.3	5.5	V
ANALOG INPUTS (Single-Ended Configuration)						
FSR	Full-scale input range (A _{INP_x} to A _{INM_x}) ⁽¹⁾	V _{REF} range	0		V _{REF}	V
		2 x V _{REF} range	0		2 x V _{REF}	
V _{INP}	Absolute input voltage (A _{INP_x} to REFGND_x) ⁽²⁾	V _{REF} range	0		V _{REF}	V
		2 x V _{REF} range, AVDD ≥ 2 x V _{REF}	0		2 x V _{REF}	
V _{INM}	Absolute input voltage (A _{INM_x} to REFGND_x)		-0.1		0.1	V
ANALOG INPUTS (Pseudo-Differential Configuration)						
FSR	Full-scale input range (A _{INP_x} to A _{INM_x}) ⁽¹⁾	V _{REF} range	-V _{REF} / 2		V _{REF} / 2	V
		2 x V _{REF} range	-V _{REF}		V _{REF}	
V _{INP}	Absolute input voltage (A _{INP_x} to REFGND_x)	V _{REF} range	0		V _{REF}	V
		2 x V _{REF} range	0		2 x V _{REF}	
V _{INM}	Absolute input voltage (A _{INM_x} - REFGND_x)	V _{REF} range	V _{REF} / 2 - 0.1	V _{REF} / 2	V _{REF} / 2 + 0.1	V
		2 x V _{REF} range	V _{REF} - 0.1	V _{REF}	V _{REF} + 0.1	
EXTERNAL REFERENCE INPUT						
V _{REFIO}	REFIO_x ⁽³⁾ input voltage	V _{REF} range	2.4	2.5	AVDD	V
		2 x V _{REF} range	2.4	2.5	AVDD / 2	
TEMPERATURE RANGE						
T _A	Ambient temperature		-40	25	125	°C

(1) A_{INP_x} refers to analog input pins A_{INP_A} and A_{INP_B}. A_{INM_x} refers to analog input pins A_{INM_A} and A_{INM_B}.

(2) REFGND_x refers to reference ground pins REFGND_A and REFGND_B.

(3) REFIO_x refers to voltage reference inputs REFIO_A and REFIO_B.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ADS8355	
		RTE (WQFN)	
		16 PINS	
			UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	33.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	29.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	7.3	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.2	°C/W
Y_{JB}	Junction-to-board characterization parameter	7.4	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	0.9	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

at $AVDD = 5\text{ V}$, $DVDD = 2.35\text{ V to }5.5\text{ V}$, $V_{REFIO_A} = V_{REFIO_B} = 5\text{ V}$ (external) and $f_{SAMPLE} = 1\text{ MSPS}$ (unless otherwise noted); minimum and maximum values at $T_A = -40^\circ\text{C to }125^\circ\text{C}$; typical values are at $T_A = 25^\circ\text{C}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
RESOLUTION						
	Resolution		16			Bits

7 Detailed Description

7.1 Overview

The ADS8355 is a 16-bit, 1-MSPS, dual, simultaneous-sampling, analog-to-digital converter (ADC) with an integrated programmable reference. The ADS8355 supports single-ended and pseudo-differential input signals. The device provides a simple, serial interface to the host controller and operates over a wide range of analog and digital power supplies.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Reference

The device has two simultaneous sampling ADCs: ADC_A and ADC_B. ADC_A and ADC_B operate with reference voltages V_{REF_A} and V_{REF_B} present on the REFIO_A and REFIO_B pins, respectively. Decouple the REFIO_A and REFIO_B pins with the REFGND_A and REFGND_B pins, respectively, with 10- μ F decoupling capacitors.

As illustrated in [Figure 24](#), the device supports operation either with an internal or external reference source. The reference voltage source is determined by programming the INT_EXT bit of the REF_SEL register. This bit is common to ADC_A and ADC_B.

Feature Description (continued)

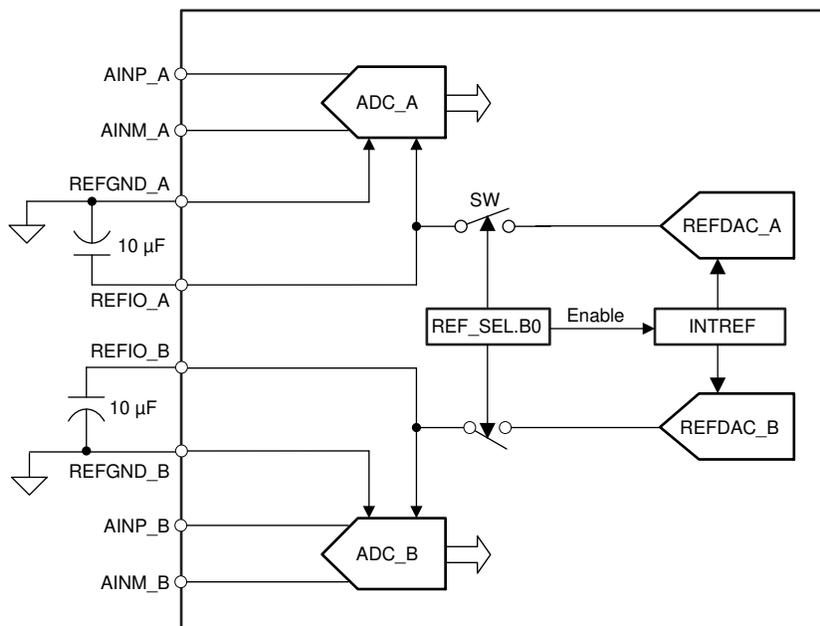

Figure 24. Reference Configurations and Connections

The default value of the REF_SEL register bit INT_EXT is set to 0. The device ADC_A and ADC_B operate with the external reference voltages provided on the REFIO_A and REFIO_B pins, respectively.

When the REF_SEL register bit INT_EXT is set to 1, the device operates with the internal reference source connected to REFIO_A and REFIO_B. The individual reference voltages can be set independently by programming the REFDAC_A and REFDAC_B values, respectively. For a 2.5-V internal reference, program REFDAC_x with a 0x1FF value..

Figure 25 shows a typical transfer function for the internal REFDAC when the internal reference is enabled.

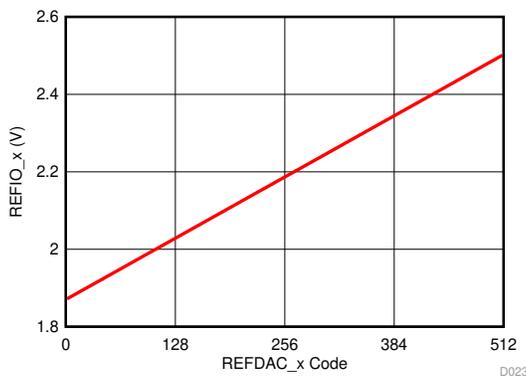

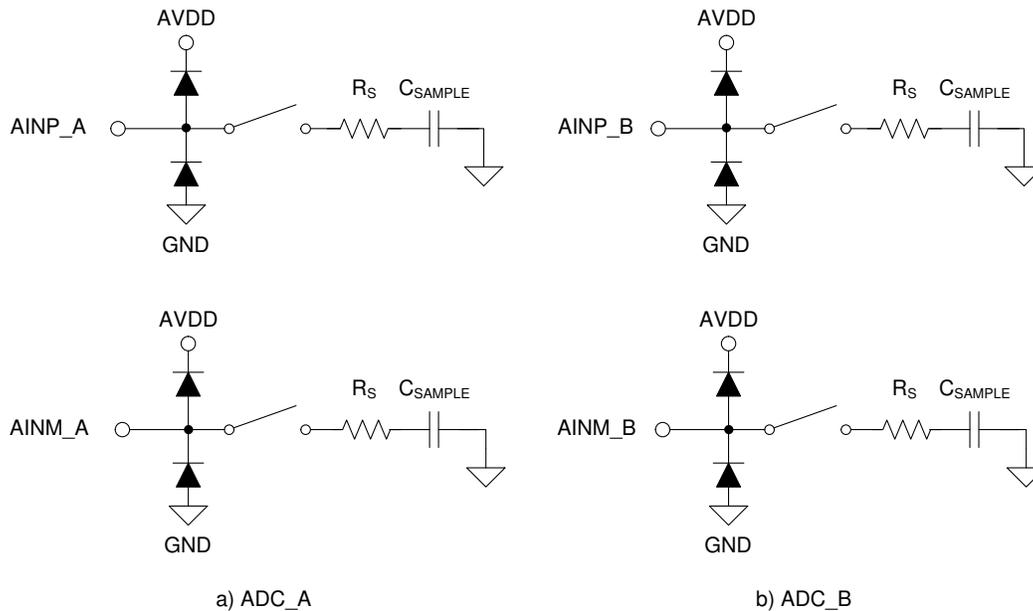

Figure 25. REFDAC Transfer Function

7.3.2 Analog Inputs

The ADS8355 supports single-ended or pseudo-differential analog input signals on both ADC channels. These inputs are sampled and converted simultaneously by the two ADCs, ADC_A and ADC_B. ADC_A samples and converts $(V_{AINP_A} - V_{AINM_A})$, and ADC_B samples and converts $(V_{AINP_B} - V_{AINM_B})$.

Figure 26 depicts equivalent circuits for the ADC_A and ADC_B analog input pins. Series resistance, R_S , represents the on-state sampling switch resistance (typically 50 Ω) and C_{SAMPLE} is the device sampling capacitor (typically 40 pF).

Feature Description (continued)

Figure 26. Equivalent Circuit for the Analog Input Pins
7.3.2.1 Analog Input: Full-Scale Range Selection

The full-scale range (FSR) supported at the analog inputs of the device is programmable with the RANGE_SEL bit of the INPUT_CONFIG register. The RANGE_SEL bit has a default value of low. This bit is common for both ADCs (ADC_A and ADC_B). [Equation 1](#) and [Equation 2](#) give the FSR.

$$\text{RANGE_SEL} = 0, \text{FSR_ADC_A} = 0 \text{ to } V_{\text{REF_A}} \text{ and } \text{FSR_ADC_B} = 0 \text{ to } V_{\text{REF_B}} \quad (1)$$

$$\text{For RANGE_SEL} = 1, \text{FSR_ADC_A} = 0 \text{ to } 2 \times V_{\text{REF_A}} \text{ and } \text{FSR_ADC_B} = 0 \text{ to } 2 \times V_{\text{REF_B}} \quad (2)$$

$V_{\text{REF_A}}$ and $V_{\text{REF_B}}$ are the reference voltages going to ADC_A and ADC_B, respectively (as described in the [Reference](#) section).

When operating with internal reference mode, the maximum dynamic range of the ADC can be used by programming the appropriate setting for the INPUT_CONFIG and REFDAC_x registers.

Ensure that the ADC analog supply (AVDD) meets the criteria defined in [Equation 3](#) and [Equation 4](#) when the RANGE_SEL bit is set to 1.

$$2 \times V_{\text{REF_A}} \leq \text{AVDD} \leq \text{AVDD}(\text{max}) \quad (3)$$

$$2 \times V_{\text{REF_B}} \leq \text{AVDD} \leq \text{AVDD}(\text{max}) \quad (4)$$

7.3.2.2 Analog Input: Single-Ended and Pseudo-Differential Configurations

The ADS8355 can support single-ended or pseudo-differential input configuration. The device operates in single-ended configuration by default.

The AINM_SEL bit in the INPUT_CONFIG register determines the input configuration used for the input pins. The selection is common for both input channels.

Program the AINM_SEL pin to logic low to operate the device in single-ended input configuration. Connect the AINM_A and AINM_B inputs to GND.

Program the AINM_SEL pin to logic high to operate the device in pseudo-differential input configuration. Connect the AINM_A and AINM_B inputs to a voltage equivalent to $\text{FSR_ADC_A} / 2$ and $\text{FSR_ADC_B} / 2$, respectively.

[Table 1](#) summarizes the analog input pin connections based on the various user settings.

Feature Description (continued)
Table 1. Input Configurations and Connections

INPUT RANGE SELECTION RANGE_SEL	INPUT CONFIGURATION SELECTION AINM_SEL	AINP_X	AINM_X
0	0	Input signal range 0 to V_{REF_X}	Connect to GND
1	0	Input signal range 0 to $2 \times V_{REF_X}$	Connect to GND
0	1	Input signal range 0 to V_{REF_X}	Connect to $V_{REF_X} / 2$
1	1	Input signal range 0 to $2 \times V_{REF_X}$	Connect to V_{REF_X}

7.3.3 Transfer Function

The device supports two input configurations:

1. Default, single-ended inputs, INPUT_CONFIG register bit 0 = 0
2. Pseudo-differential inputs, INPUT_CONFIG register bit 0 = 1

The device supports two output data formats:

1. Default, straight binary output, DATA_OUT_CTRL register bit 0 = 0
2. Two's compliment output, DATA_OUT_CTRL register bit 0 = 1

Equation 5 calculates the device resolution:

$$1 \text{ LSB} = (\text{FSR_ADC}_x) / (2^N)$$

where:

- $N = 16$ and
 - FSR_ADC_x is the full-scale input range of the ADC
- (5)

Table 2 and Table 3 show the different input voltages and the corresponding output codes from the device.

Table 2. Transfer Characteristics for Straight Binary Output (Default)

INPUT CONFIGURATION	INPUT VOLTAGE			OUTPUT CODE (Hex)	
	AINP_x	AINM_x	AINP_x - AINM_x	STRAIGHT BINARY	
				CODE	ADS8355

7.4 Device Functional Modes

7.4.1 Conversion Data Read: Dual-SDO Mode (Default)

The dual-SDO mode is designed to support the maximum throughput at lower SCLK frequencies.

The single-SDO mode is enabled by programming the SDO_MODE bit in the SDO_CTRL register to logic low. In this mode, the SDO_A pin outputs the ADC_A conversion result and the SDO_B pin outputs the ADC_B conversion result. Figure 29 shows a detailed timing diagram for this mode.

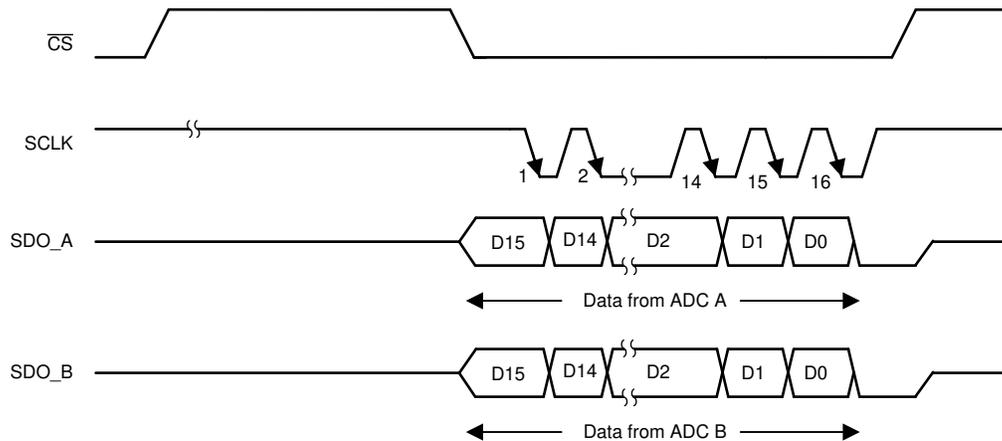

Figure 29. Dual-SDO Mode Timing Diagram

A \overline{CS} rising edge forces SDO_x to tri-state. \overline{CS} also samples the input signal and causes the device to enter conversion phase. Conversion is done with the internal clock. \overline{CS} and SCLK must remain high for a minimum time of t_{CONV} . A \overline{CS} falling edge brings the serial data bus out of tri-state and the device outputs the MSB of the data. The lower data bits are output on the subsequent SCLK falling edges. SDO_A and SDO_B go low after the 16th SCLK falling edge. The SDO_x signals remain low until the \overline{CS} signal is pulled high.

Device Functional Modes (continued)

7.4.2 Conversion Data Read: Single-SDO Mode

The single-SDO mode is designed to support operation with a wide variety of hosts that can support only one master in, slave out (MISO) signal for the SPI interface. The maximum throughput is limited based on the SCLK frequency supported by the host.

The single-SDO mode is enabled by programming the SDO_MODE bit in the SDO_CTRL register to logic high. In this mode, the SDO_A pin outputs the conversion results for ADC_A followed by ADC_B. Figure 30 shows a detailed timing diagram for this mode.

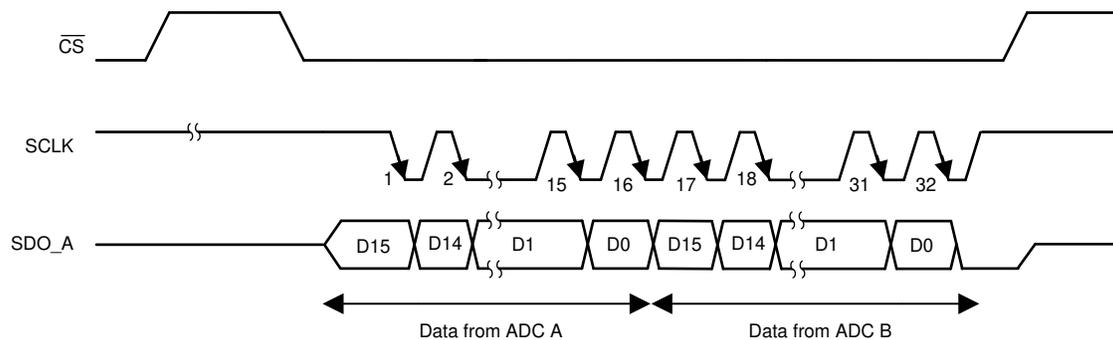

Figure 30. Single-SDO Mode Timing Diagram

A \overline{CS} rising edge forces SDO_x to tri-state. \overline{CS} also samples the input signal and causes the device to enter conversion phase. Conversion is done with the internal clock. \overline{CS} and SCLK must remain high for a minimum time of t_{CONV} . A \overline{CS} falling edge brings the serial data bus out of tri-state and the device outputs the MSB of the ADC_A conversion result. The lower data bits are output on the subsequent SCLK falling edges. After ADC_A, the device outputs the ADC_B conversion result starting from 17th falling edge of SCLK. SDO_A drives the output line to a zero logic level after 32nd falling edge of SCLK. SDO_A remains low until the \overline{CS} signal is pulled high. SDO_B is driven low when the SPI interface is active in single-SDO mode.

7.4.3 Low-Power Modes

In normal mode of operation, all internal circuits of the device are always powered up and the device is ready to commence a new conversion when \overline{CS} is pulled high. The device also supports two low-power modes to optimize the power consumption at lower throughput or when the device is not expected to perform conversions.

7.4.3.1 STANDBY Mode

The device supports a standby mode of operation where the ADCs and the internal oscillator are powered down to save power. The internal reference, if already enabled, stays enabled and the contents of the REFDAC_A and REFDAC_B registers are retained to enable faster power-up to a normal mode of operation.

Standby mode is enabled by programming the PD_KEY register with 0x09h followed by setting the STANDBY bit in the PD_STANDBY register with logic high. See the [Register Map](#) section for the register setting information. See the [Register Read/Write Operation](#) section for timing information for register access.

Standby mode is disabled by programming the PD_KEY register with 0x09h followed by setting the STANDBY bit in the PD_STANDBY register with logic low. After existing standby mode, a delay of 10 μ s must elapse for the internal circuits to power up and resume normal operation.

7.4.3.2 PD (Power-Down) Mode

The device supports a PD (power-down) mode of operation where all internal blocks except the interface and I/O are powered down to save power.

PD mode is enabled by programming the PD_KEY register with 0x09h followed by setting the PD_EN bit in the PD_STANDBY register with logic high. See the [Register Map](#) section for the register setting information. See the [Register Read/Write Operation](#) section for timing information for register access.

Device Functional Modes (continued)

PD mode is disabled by programming the PD_KEY register with 0x09h followed by setting the PD_EN bit in the PD_STANDBY register with logic low. After exiting PD mode, a delay of 1 ms must elapse with the external reference mode and 3 ms must elapse with the internal reference mode for the internal circuits to power up and resume normal operation.

7.5 Programming

7.5.1 Register Read/Write Operation

This device features configuration registers and supports the commands listed in Table 4 to access the internal configuration registers.

Table 4. Supported Commands

B[19:16]	B[15:8]	B[7:0]	COMMAND ACRONYM	COMMAND DESCRIPTION
0000	000000000000	00000000	NOP	No operation. Next frame provides the ADC conversion result output on the SDO_X lines.
0001	<8-bit address>	<8-bit data>	WR_REG	Write <8-bit data> to the <8-bit address>
0010	<8-bit address>	00000000	RD_REG	Read contents from the <8-bit address>
0011	<8-bit address>	<8-bit unmasked bits>	SET_BITS	Set <8-bit unmasked bits> from <8-bit address>
0100	<8-bit address>	<8-bit unmasked bits>	CLR_BITS	Clear <8-bit unmasked bits> from <8-bit address>
Remaining combinations	xxxxxxxx	xxxxxxxx	Reserved	These commands are reserved and treated by the device as no operation.

The ADS8355 supports two types of data transfer operations: *data write* (the host controller configures the device), and *data read* (the host controller reads data from the device).

Any data write to the device is always synchronous to the external clock provided on the SCLK pin. The WR_REG command writes the 8-bit data into the 8-bit address specified in the command string. The CLR_BITS command clears the specified bits (identified by 1) at the 8-bit address (without affecting the other bits), and the SET_BITS command sets the specified bits (identified by 1) at the 8-bit address (without affecting the other bits).

Figure 31 shows the digital waveform for a register read operation. A register read operation consists of two frames: one frame to initiate a register read and a second frame to read data from the register address provided in the first frame. As shown in Figure 31, the 8-bit register address and the 8-bit dummy data are sent over the SDI pin during the first 20-bit frame with the read command (0010b). The 20-bit command information is right-aligned with the frame. If a command frame is smaller than 20 bits, the contents of the command are discarded. If a frame has more than 20 bits, the last 20 bits are used to decode the operation. When CS goes from low to high, this read command is decoded and the requested register data are available for reading during the next frame. During the second frame, the first eight bits on SDO_A correspond to the requested register read. During the second frame, SDI can be used to initiate another operation or can be set to 0.

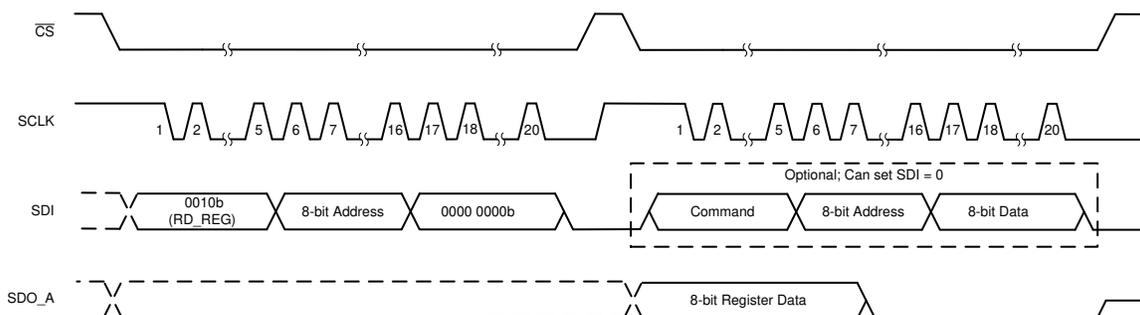

Figure 31. Register Read Operation

Figure 32 shows that for writing data to the register, one 20-bit frame is required. The frame contents are right-aligned. If a command frame is smaller than 20 bits, the contents of the command are discarded. If a frame has more than 20 bits, the last 20 bits are used to decode the operation. The 20-bit data on SDI consists of a 4-bit write command (0001b), set bit command (0011b), or clear bit command (0100b), an 8-bit register address, and 8-bit data. The write command is decoded on the CS rising edge and the specified register is updated with the 8-bit data specified during the register write operation.

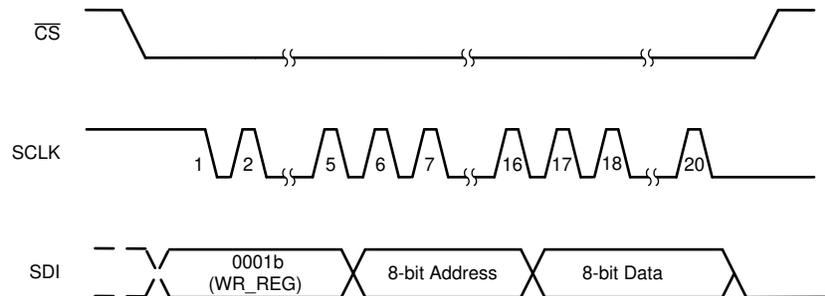

Figure 32. Register Write Operation

7.6 Register Map

7.6.1 ADS8355 Registers

Table 5 lists the ADS8355 registers. All register offset addresses not listed in Table 5 should be considered as reserved locations and the register contents should not be modified.

Table 5. ADS8355 Registers

Offset	Acronym	Register Name	Section
4h	PD_STANDBY	Power down configuration register	PD_STANDBY Register (Offset = 4h) [reset = 0h]
5h	PD_KEY	Power down key register	PD_KEY Register (Offset = 5h) [reset = 0h]
Dh	SDO_CTRL	SDO mode selection register	SDO_CTRL Register (Offset = Dh) [reset = 0h]
11h	DATA_OUT_CTRL	Output data format register	DATA_OUT_CTRL Register (Offset = 11h) [reset = 0h]
20h	REF_SEL	ADC reference selection register	REF_SEL Register (Offset = 20h) [reset = 0h]
24h	REFDAC_A_LSB	REFDAC_A configuration register (LSB)	REFDAC_A_LSB Register (Offset = 24h) [reset = 0h]
25h	REFDAC_A_MSB	REFDAC_A configuration register (MSB)	REFDAC_A_MSB Register (Offset = 25h) [reset = 0h]
26h	REFDAC_B_LSB	REFDAC_B configuration register (LSB)	REFDAC_B_LSB Register (Offset = 26h) [reset = 0h]
27h	REFDAC_B_MSB	REFDAC_B configuration register (MSB)	REFDAC_B_MSB Register (Offset = 27h) [reset = 0h]
28h	INPUT_CONFIG	Analog input configuration register	INPUT_CONFIG Register (Offset = 28h) [reset = 0h]

Complex bit access types are encoded to fit into small table cells. Table 6 shows the codes that are used for access types in this section.

Table 6. ADS8355 Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		

Table 6. ADS8355 Access Type Codes (continued)

Access Type	Code	Description
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

7.6.1.1 PD_STANDBY Register (Offset = 4h) [reset = 0h]

PD_STANDBY is shown in [Figure 33](#) and described in [Table 7](#).

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The two primary circuits required to maximize the performance of a high-precision, successive approximation register (SAR), analog-to-digital converter (ADC) are the input driver and the reference driver circuits. This section details some general principles for designing these circuits, and some application circuits designed using these devices.

The device supports operation either with an internal or external reference source. See the [Reference](#) section for details about the decoupling requirements.

The reference source to the ADC must provide low-drift and very accurate DC voltage and support the dynamic charge requirements without affecting the noise and linearity performance of the device. The output broadband noise (typically in the order of a few 100 μV_{RMS}) of the reference source must be appropriately filtered by using a low-pass filter with a cutoff frequency of a few hundred hertz. After band-limiting the noise from the reference source, the next important step is to design a reference buffer that can drive the dynamic load posed by the reference input of the ADC. At the start of each conversion, the reference buffer must regulate the voltage of the reference pin within 1 LSB of the intended value. This condition necessitates the use of a large filter capacitor at the reference pin of the ADC. The amplifier selected to drive the reference input pin must be stable while driving this large capacitor and must have low output impedance, low offset, and temperature drift specifications. To reduce the dynamic current requirements and crosstalk between the channels, a separate reference buffer is recommended for driving the reference input of each ADC channel.

The input driver circuit for a high-precision ADC mainly consists of two parts: a driving amplifier and a fly-wheel RC filter. The amplifier is used for signal conditioning of the input voltage and its low output impedance provides a buffer between the signal source and the switched capacitor inputs of the ADC. The RC filter helps attenuate the sampling charge injection from the switched-capacitor input stage of the ADC and functions as a charge kickback filter to band-limit the wideband noise contributed by the front-end circuit. Careful design of the front-end circuit is critical to meet the linearity and noise performance of a high-precision ADC.

8.1.1 Input Amplifier Selection

Selection criteria for the input amplifiers is highly dependent on the input signal type and the performance goals of the data acquisition system. Some key amplifier specifications to consider when selecting an appropriate amplifier to drive the inputs of the ADC are:

- **Small-signal bandwidth.** Select the small-signal bandwidth of the input amplifiers to be as high as possible after meeting the power budget of the system. Higher bandwidth reduces the closed-loop output impedance of the amplifier, thus allowing the amplifier to more easily drive the low cutoff frequency RC filter at the ADC inputs. Higher bandwidth also minimizes the harmonic distortion at higher input frequencies. Select the amplifier bandwidth as described in [Equation 6](#) to maintain the overall stability of the input driver circuit:

$$\text{Unity - Gain Bandwidth} \geq 4 \times \left(\frac{1}{2\pi \times (R_{FLT} + R_{FLT}) \times C_{FLT}} \right) \quad (6)$$

Application Information (continued)

- **Noise.** Noise contribution of the front-end amplifiers must be as low as possible to prevent any degradation in SNR performance of the system. As a rule of thumb, to ensure that the noise performance of the data acquisition system is not limited by the front-end circuit, keep the total noise contribution from the front-end circuit below 20% of the input-referred noise of the ADC. Equation 7 calculates noise from the input driver circuit. This noise is band-limited by designing a low cutoff frequency RC filter:

$$N_G \times \sqrt{2} \times \sqrt{\left(\frac{V_{1/f_AMP_PP}}{6.6}\right)^2 + e_{n_RMS}^2 \times \frac{\pi}{2} \times f_{-3dB}} \leq \frac{1}{5} \times \frac{V_{REF}}{\sqrt{2}} \times 10^{-\left(\frac{SNR(dB)}{20}\right)}$$

where:

- V_{1/f_AMP_PP} = the peak-to-peak flicker noise in μV
- e_{n_RMS} = the amplifier broadband noise density in nV/\sqrt{Hz}
- f_{-3dB} = the 3-dB bandwidth of the RC filter
- N_G = the noise gain of the front-end circuit, which is equal to 1 in a buffer configuration (7)
- **Distortion.** Both the ADC and the input driver introduce nonlinearity in a data acquisition block. As a rule of thumb, the distortion of the input driver must be at least 10 dB lower than the distortion of the ADC, as shown in Equation 8, to ensure that the distortion performance of the data acquisition system is not limited by the front-end circuit.

$$THD_{AMP} \leq THD_{ADC} - 10 \text{ (dB)} \quad (8)$$

- **Settling Time.** For DC signals with fast transients that are common in a multiplexed application, the input signal must settle to the desired accuracy at the inputs of the ADC during the acquisition time window. This condition is critical to maintain the overall linearity performance of the ADC. Typically, the amplifier data sheets specify the output settling performance only up to 0.1% to 0.001%, which may not be sufficient for the desired accuracy. Therefore, always verify the settling behavior of the input driver with TINA™-SPICE simulations before selecting the amplifier.

8.1.2 Charge Kickback Filter

Converting analog-to-digital signals requires sampling an input signal at a constant rate. Any higher frequency content in the input signal beyond half the sampling frequency is digitized and folded back into the low-frequency spectrum. This process is called *aliasing*. Therefore, an analog, charge kickback filter must be used to remove the harmonic content from the input signal before being sampled by the ADC. A charge kickback filter is designed as a low-pass, RC filter, for which the 3-dB bandwidth is optimized based on specific application requirements. For DC signals with fast transients (including multiplexed input signals), a high-bandwidth filter is designed to allow accurately settling the signal at the ADC inputs during the small acquisition time window. For AC signals, keep the filter bandwidth low to band-limit the noise fed into the ADC input, thereby increasing the signal-to-noise ratio (SNR) of the system.

A filter capacitor, C_{FLT} , connected across the ADC inputs (see Figure 43), filters the noise from the front-end drive circuitry, reduces the sampling charge injection, and provides a charge bucket to quickly charge the internal sample-and-hold capacitors during the acquisition process. As a rule of thumb, the value of this capacitor must be at least 10 times the specified value of the ADC sampling capacitance. For these devices, the input sampling capacitance is equal to 40 pF. Thus, the value of C_{FLT} must be greater than 400 pF. The capacitor must be a COG- or NPO-type because these capacitor types have a high-Q, low-temperature coefficient, and stable electrical characteristics under varying voltages, frequency, and time.

Application Information (continued)

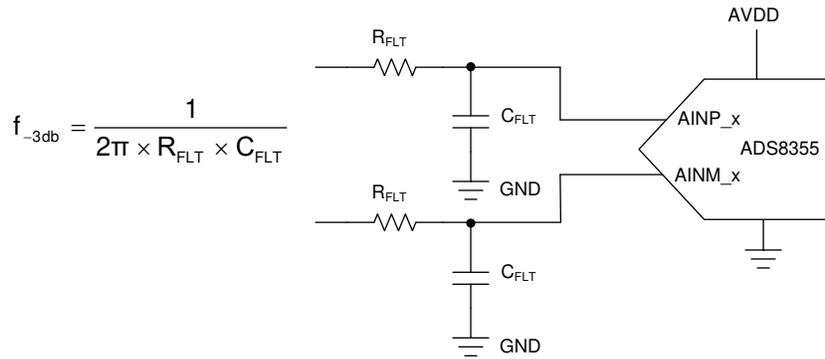

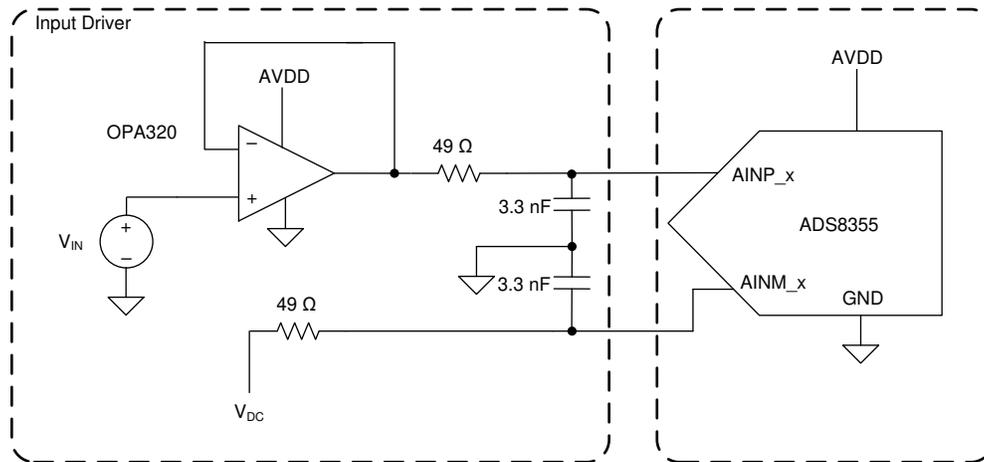

Figure 43. Charge Kickback Filter

Driving capacitive loads can degrade the phase margin of the input amplifiers, thus making the amplifier marginally unstable. To avoid amplifier stability issues, series isolation resistors (R_{FLT}) are used at the output of the amplifiers. A higher value of R_{FLT} is helpful from the amplifier stability perspective, but adds distortion as a result of interactions with the nonlinear input impedance of the ADC. Distortion increases with source impedance, input signal frequency, and input signal amplitude. Therefore, the selection of R_{FLT} requires balancing the stability and distortion of the design. For more information on ADC input R-C filter component selection, see the [TI Precision Labs on ti.com](#).

8.2 Typical Application

NOTE: Only one ADC channel is shown in this diagram. Replicate the same circuit for the other ADC channel.

Figure 44. DAQ Circuit: Maximum SINAD for a 10-kHz Input Signal at Full Throughput

Typical Application (continued)

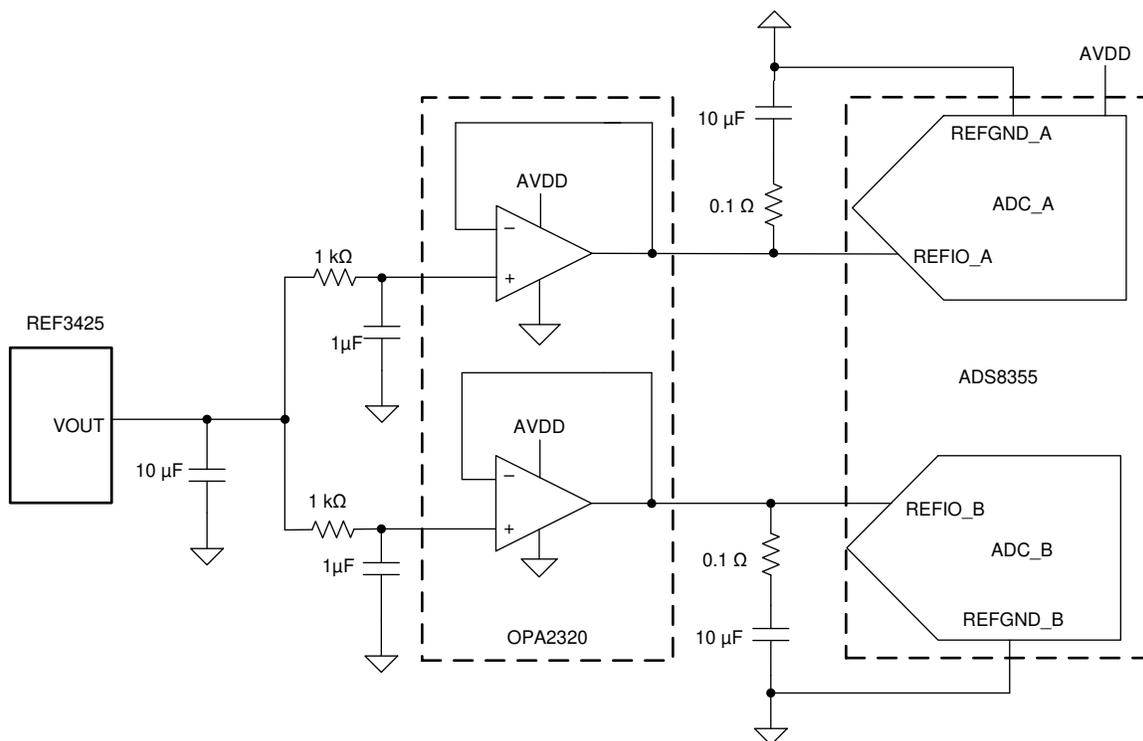

Figure 45. Reference Drive Circuit

8.2.1 Design Requirements

Table 17 lists the target specifications for this application.

Table 17. Target Specifications

TARGET SPECIFICATIONS	TEST CONDITIONS
> 83-dB SNR, < -95-dB THD	10-kHz input signal frequency, 1-MSPS throughput

8.2.2 Detailed Design Procedure

Best practice is for the distortion from the input driver to be at least 10 dB less than the ADC distortion. The distortion resulting from variation in the common-mode signal is eliminated by using the amplifier in an inverting gain configuration that establishes a fixed common-mode level for the circuit. This configuration also eliminates the requirement of rail-to-rail swing at the amplifier input. The low-power OPA320, used as an input driver, provides exceptional AC performance because of its extremely low-distortion and high-bandwidth specifications. In addition, the components of the antialiasing filter are such that the noise from the front-end circuit is kept low without adding distortion to the input signal.

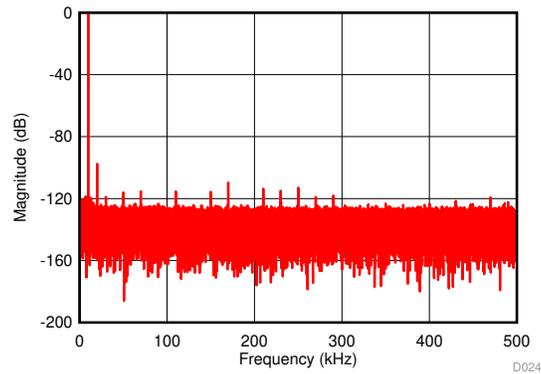

The application circuit illustrated in Figure 44 is optimized to achieve the lowest distortion and lowest noise for a 10-kHz input signal fed to the ADS8355 operating at full throughput with the default dual-SDO interface mode. The input signal is processed through a high-bandwidth, low-distortion amplifier in an inverting gain configuration and a low-pass RC filter before being fed into the device.

Figure 45 illustrates the reference driver circuit when operation with an external reference is desired. The reference voltage is generated by the high-precision, low-noise REF3425 circuit. The output broadband noise of the reference is heavily filtered by a low-pass filter with a 3-dB cutoff frequency of 160 Hz. The decoupling capacitor on each reference pin is selected to be 10 µF. The low output impedance, low noise, and fast settling time make the OPA2320 a good choice for driving this high capacitive load.

8.2.3 Application Curve

To minimize external components and to maximize the dynamic range of the ADC, the device is configured to operate with an internal reference (REF_SEL register, INT_EXT bit = 1) and a $2 \times V_{REF_X}$ input full-scale range (INPUT_CONFIG register, RANGE_SEL bit = 1). The REFDAC_x registers are programmed to 0x1FFh to program the internal reference to 2.5 V.

Figure 46 shows the FFT plot and test result obtained with the ADS8355 operating at full throughput with a dual-SDO interface and the circuit configuration of Figure 44.

SNR = 86.38 dB, THD = -97.24 dB, $f_{IN} = 10$ kHz

Figure 46. The ADS8355 in Dual-SDO Interface Mode

9 Power Supply Recommendations

The device has two separate power supplies: AVDD and DVDD. The device operates on AVDD; DVDD is used for the interface circuits. AVDD and DVDD can be independently set to any value within the permissible ranges.

When using the device with the $2 \times V_{REF}$ input range (INPUT_CONFIG register, RANGE_SEL bit = 1), the AVDD supply voltage value defines the permissible voltage swing on the analog input pins. AVDD must be set as described in [Equation 3](#) and [Equation 4](#) to avoid saturation of output codes and to use the full dynamic range on the analog input pins.

Decouple the AVDD and DVDD pins, as shown in [Figure 47](#), with the GND pin using individual 10- μ F decoupling capacitors.

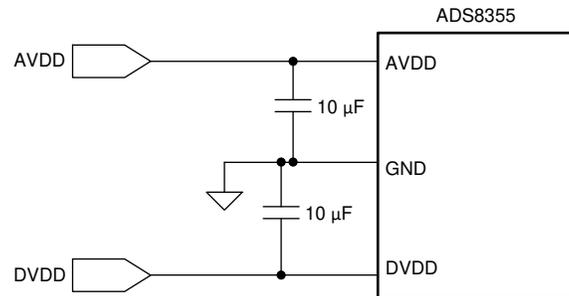

Figure 47. Power-Supply Decoupling

10 Layout

10.1 Layout Guidelines

[Figure 48](#) provides a board layout example for the device WQFN package. Partition the printed circuit board (PCB) into analog and digital sections. Avoid crossing digital lines with the analog signal path and keep the analog input signals and the reference input signals away from noise sources. As illustrated in [Figure 48](#), the analog input and reference signals are routed on the left side of the board and the digital connections are routed on the right side of the device.

The power sources to the device must be clean and well-bypassed. Use 10- μ F, ceramic bypass capacitors in close proximity to the analog (AVDD) and digital (DVDD) power-supply pins. Avoid placing vias between the AVDD and DVDD pins and the bypass capacitors. Connect all ground pins to the ground plane using short, low impedance paths.

The REFIO_A and REFIO_B reference inputs and outputs are bypassed with 10- μ F, X7R-grade, 0805-size, 16-V rated ceramic capacitors (C_{REF_x}). Place the reference bypass capacitors as close as possible to the reference REFIO_x pins and connect the bypass capacitors using short, low-inductance connections. Avoid placing vias between the REFIO_x pins and the bypass capacitors.

The fly-wheel RC filters are placed immediately next to the input pins. Among ceramic surface-mount capacitors, COG (NPO) ceramic capacitors provide the best capacitance precision. The type of dielectric used in COG (NPO) ceramic capacitors provides the most stable electrical properties over voltage, frequency, and temperature changes.

11.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.4 Community Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

11.5 Trademarks

TINA, E2E are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

11.6 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.7 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADS8355IRTER	ACTIVE	WQFN	RTE	16	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	8355	Samples
ADS8355IRTET	ACTIVE	WQFN	RTE	16	250	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	8355	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
