

Serial real-time clock

Datasheet - production data

Features

- 2.0 to 5.5 V clock operating voltage
- Counters for seconds, minutes, hours, day, date, month, year, and century
- Software clock calibration
- Automatic switchover and deselect circuitry (fixed reference)
- $V_{CC} = 2.7$ to 5.5 V
 2.5 V $\leq V_{PFD} \leq 2.7$ V
- Serial interface supports I²C bus (400 kHz protocol)
- Low operating current of 300 μ A
- Oscillator stop detection
- Battery or SuperCapTM backup
- Operating temperature of - 40 to 85 °C
- Ultra-low battery supply current of 0.6 μ A

Description

The M41T00S is a low-power serial real-time clock (RTC) with a built-in 32.768 kHz oscillator (external crystal controlled). Eight bytes of the SRAM are used for the clock/calendar function and are configured in binary coded decimal (BCD) format. Addresses and data are transferred serially via a two line, bidirectional I²C interface.

The built-in address register is incremented automatically after each WRITE or READ data byte.

The M41T00S has a built-in power sense circuit which detects power failures and automatically switches to the battery supply when a power failure occurs. The energy needed to sustain the clock operations can be supplied by a small lithium button supply when a power failure occurs. The eight clock address locations contain the century, year, month, date, day, hour, minute, and second in 24-hour BCD format. Corrections for 28, 29 (leap year - valid until year 2100), 30 and 31 day months are made automatically.

The M41T00S is supplied in an 8-pin SOIC.

Block diagram of the DS1307 Real Time Clock (RTC) circuit. The diagram shows the internal components and their connections:

- CRYSTAL**: Connected to the **32KHz OSCILLATOR**.
- 32KHz OSCILLATOR**: Connected to the **REAL TIME CLOCK CALENDAR** block.
- REAL TIME CLOCK CALENDAR**: Contains sub-blocks: **OSCILLATOR FAIL CIRCUIT**, **RTC & CALIBRATION**, **FREQUENCY TEST**, and **OUTPUT DRIVER**.
- I²C INTERFACE**: Connected to the **REAL TIME CLOCK CALENDAR** block. It has inputs for **SDA** and **SCL**.
- WRITE PROTECT**: A pin connected to the **I²C INTERFACE** and the **REAL TIME CLOCK CALENDAR** block.
- INTERNAL POWER**: A pin connected to the **REAL TIME CLOCK CALENDAR** block and the **COMPARE** block.
- COMPARE**: A block with inputs **V_{CC}**, **V_{BAT}**, **V_{SO}**, and **V_{PFD}**. Its output is connected to the **INTERNAL POWER** pin.
- FT/OUT⁽¹⁾**: An output from the **FREQUENCY TEST** block, connected to the **OUTPUT DRIVER** block.
- OUT**: An output from the **OUTPUT DRIVER** block.

2 Operation

The M41T00S clock operates as a slave device on the serial bus. Access is obtained by implementing a start condition followed by the correct slave address (D0h). The 8 bytes contained in the device can then be accessed sequentially in the following order:

1. Seconds register
2. Minutes register
3. Century/hours register
4. Day register
5. Date register
6. Month register
7. Year register
8. Calibration register

The M41T00S clock continually monitors V_{CC} for an out-of-tolerance condition. Should V_{CC} fall below V_{PFD} , the device terminates an access in progress and resets the device address counter. Inputs to the device will not be recognized at this time to prevent erroneous data from being written to the device from an out-of-tolerance system. Once V_{CC} falls below the switchover voltage (V_{SO}), the device automatically switches over to the battery and powers down into an ultra-low current mode of operation to preserve battery life.

$$V_{SO} = \begin{cases} V_{BAT} & \text{if } V_{BAT} < V_{PFD} \\ V_{PFD} & \text{if } V_{BAT} > V_{PFD} \end{cases}$$

Upon power-up, the device switches from battery to V_{CC} at V_{SO} . When V_{CC} rises above V_{PFD} , it will recognize the inputs.

For more information on battery storage life refer to application note AN1012.

2.1 2-wire bus characteristics

The bus is intended for communication between different ICs. It consists of two lines: a bidirectional data signal (SDA) and a clock signal (SCL). Both the SDA and SCL lines must be connected to a positive supply voltage via a pull-up resistor.

The following protocol has been defined:

- Data transfer may be initiated only when the bus is not busy.
- During data transfer, the data line must remain stable whenever the clock line is high.
- Changes in the data line, while the clock line is high, will be interpreted as control signals.

Accordingly, the following bus conditions have been defined:

2.1.1 Bus not busy

Both data and clock lines remain high.

2.1.2 Start data transfer

A change in the state of the data line, from high to low, while the clock is high, defines the START condition.

2.1.3 Stop data transfer

A change in the state of the data line, from low to high, while the clock is high, defines the STOP condition.

2.1.4 Data valid

The state of the data line represents valid data when after a start condition, the data line is stable for the duration of the high period of the clock signal. The data on the line may be changed during the low period of the clock signal. There is one clock pulse per bit of data.

Each data transfer is initiated with a start condition and terminated with a stop condition. The number of data bytes transferred between the start and stop conditions is not limited. The information is transmitted byte-wide and each receiver acknowledges with a ninth bit.

By definition a device that gives out a message is called "transmitter," the receiving device that gets the message is called "receiver." The device that controls the message is called "master." The devices that are controlled by the master are called "slaves."

2.1.5 Acknowledge

Each byte of eight bits is followed by one acknowledge bit. this acknowledge bit is a low level put on the bus by the receiver whereas the master generates an extra acknowledge related clock pulse. A slave receiver which is addressed is obliged to generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter.

The device that acknowledges has to pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is a stable low during the high period of the acknowledge related clock pulse. Of course, setup and hold times must be taken into account. A master receiver must signal an end of data to the slave transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this case the transmitter must leave the data line high to enable the master to generate the STOP condition.

Figure 4. Serial bus data transfer sequence

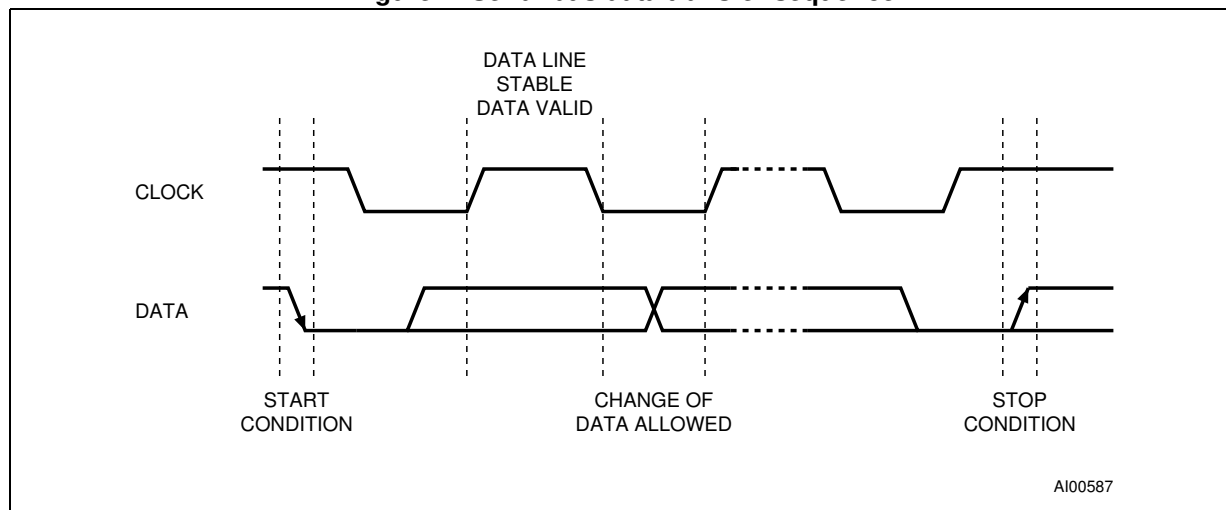

Figure 5. Acknowledgement sequence

2.2 READ mode

In this mode the master reads the M41T00S slave after setting the slave address (see [Figure 7 on page 10](#)). Following the WRITE mode control bit ($R/\bar{W}=0$) and the acknowledge bit, the word address 'An' is written to the on-chip address pointer. Next the START condition and slave address are repeated followed by the READ mode control bit ($R/\bar{W}=1$). At this point the master transmitter becomes the master receiver. The data byte which was addressed will be transmitted and the master receiver will send an acknowledge bit to the slave transmitter. The address pointer is only incremented on reception of an acknowledge clock. The M41T00S slave transmitter will now place the data byte at address $An+1$ on the bus, the master receiver reads and acknowledges the new byte and the address pointer is incremented to " $An+2$."

This cycle of reading consecutive addresses will continue until the master receiver sends a STOP condition to the slave transmitter.

The system-to-user transfer of clock data will be halted whenever the address being read is a clock address (00h to 06h). The update will resume due to a stop condition or when the pointer increments to any non-clock address (07h).

Note: This is true both in READ mode and WRITE mode.

An alternate READ mode may also be implemented whereby the master reads the M41T00S slave without first writing to the (volatile) address pointer. The first address that is read is the last one stored in the pointer (see [Figure 8 on page 10](#)).

Figure 6. Slave address location

Figure 7. READ mode sequence

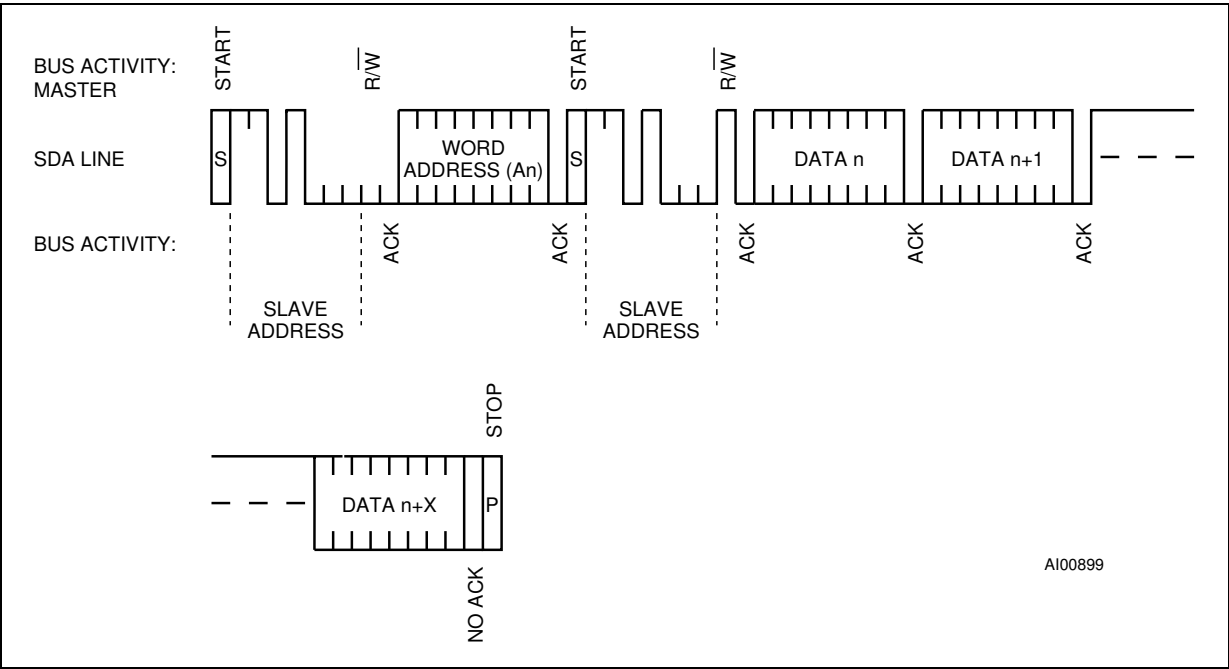

Figure 8. Alternative READ mode sequence

2.3 WRITE mode

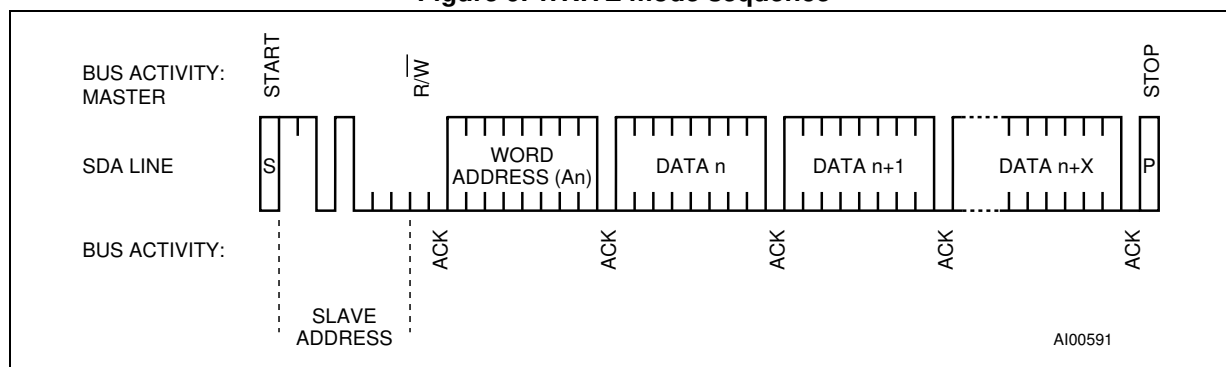

In this mode the master transmitter transmits to the M41T00S slave receiver. Bus protocol is shown in [Figure 9](#). Following the START condition and slave address, a logic '0' ($R/\overline{W}=0$) is placed on the bus and indicates to the addressed device that word address "An" will follow and is to be written to the on-chip address pointer. The data word to be written to the memory is strobed in next and the internal address pointer is incremented to the next address location on the reception of an acknowledge clock. The M41T00S slave receiver will send an acknowledge clock to the master transmitter after it has received the slave address see [Figure 6 on page 10](#) and again after it has received the word address and each data byte.

2.4 Data retention mode

With valid V_{CC} applied, the M41T00S can be accessed as described above with READ or WRITE cycles. Should the supply voltage decay, the power input will be switched from the V_{CC} pin to the battery when V_{CC} falls below the battery backup switchover voltage (V_{SO}). At this time the clock registers will be maintained by the attached battery supply. On power-up, when V_{CC} returns to a nominal value, write protection continues for t_{REC} .

For a further, more detailed review of lifetime calculations, please see Application Note AN1012.

Figure 9. WRITE mode sequence

3 Clock operation

The 8-byte register map (see [Table 2](#)) is used to both set the clock and to read the date and time from the clock, in a binary coded decimal format. Seconds, minutes, and hours are contained within the first three registers.

Bits D6 and D7 of clock register 02h (century/hours register) contain the CENTURY ENABLE bit (CEB) and the CENTURY bit (CB). Setting CEB to a '1' will cause CB to toggle, either from '0' to '1' or from '1' to '0' at the turn of the century (depending upon its initial state). If CEB is set to a '0,' CB will not toggle. Bits D0 through D2 of Register 03h contain the Day (day of week). Registers 04h, 05h, and 06h contain the date (day of month), month and years. The eighth clock register is the calibration register (this is described in the clock calibration section). Bit D7 of register 00h contains the STOP bit (ST). Setting this bit to a '1' will cause the oscillator to stop. If the device is expected to spend a significant amount of time on the shelf, the oscillator may be stopped to reduce current drain. When reset to a '0' the oscillator restarts within one second.

The seven clock registers may be read one byte at a time, or in a sequential block. The calibration register (address location 07h) may be accessed independently. Provision has been made to assure that a clock update does not occur while any of the seven clock addresses are being read. If a clock address is being read, an update of the clock registers will be halted. This will prevent a transition of data during the READ.

3.1 Clock registers

The M41T00S offers 8 internal registers which contain clock and calibration data. These registers are memory locations which contain external (user accessible) and internal copies of the data (usually referred to as BiPORT™ TIMEKEEPER cells). The external copies are independent of internal functions except that they are updated periodically by the simultaneous transfer of the incremented internal copy. The internal divider (or clock) chain will be reset upon the completion of a WRITE to any clock address.

The system-to-user transfer of clock data will be halted whenever the address being read is a clock address (00h to 06h). The update will resume either due to a stop condition or when the pointer increments to any non-clock address (07h).

Clock registers store data in BCD. The calibration register stores data in binary format.

Table 2. TIMEKEEPER® register map

Addr									Function/range BCD format	
	D7	D6	D5	D4	D3	D2	D1	D0		
00h	ST	10 seconds			Seconds			Seconds	00-59	
01h	OF	10 minutes			Minutes			Minutes	00-59	
02h	CEB	CB	10 hours		Hours (24-hour format)			Century/hours	0-1/00-23	
03h	0	0	0	0	0	Day of week		Day	01-7	
04h	0	0	10 date		Date: day of month			Date	01-31	
05h	0	0	0	10M	Month			Month	01-12	
06h	10 years				Year			Year	00-99	
07h	OUT	FT	S	Calibration				Calibration		

Keys:

0 = must be set to '0'

CB = century bit

CEB = century enable bit

FT = frequency test bit

OF = oscillator fail bit

OUT = output level

S = sign bit

ST = stop bit

3.2 Calibrating the clock

The M41T00S is driven by a quartz-controlled oscillator with a nominal frequency of 32,768 Hz. The devices are tested not exceed ± 35 ppm (parts per million) oscillator frequency error at 25°C, which equates to about ± 1.53 minutes per month (see [Figure 10 on page 15](#)). When the calibration circuit is properly employed, accuracy improves to better than ± 2 ppm at 25°C.

The oscillation rate of crystals changes with temperature. The M41T00S design employs periodic counter correction. The calibration circuit adds or subtracts counts from the oscillator divider circuit at the divide by 256 stage, as shown in [Figure 11 on page 15](#). The number of times pulses which are blanked (subtracted, negative calibration) or split (added, positive calibration) depends upon the value loaded into the five calibration bits found in the calibration register. Adding counts speeds the clock up, subtracting counts slows the clock down.

The calibration bits occupy the five lower order bits (D4-D0) in the calibration register 07h. These bits can be set to represent any value between 0 and 31 in binary form. Bit D5 is a Sign bit; '1' indicates positive calibration, '0' indicates negative calibration. Calibration occurs within a 64 minute cycle. The first 62 minutes in the cycle may, once per minute, have one second either shortened by 128 or lengthened by 256 oscillator cycles. If a binary '1' is loaded into the register, only the first 2 minutes in the 64 minute cycle will be modified; if a binary 6 is loaded, the first 12 will be affected, and so on.

Therefore, each calibration step has the effect of adding 512 or subtracting 256 oscillator cycles for every 125,829,120 actual oscillator cycles, that is +4.068 or –2.034 ppm of adjustment per calibration step in the calibration register (see [Figure 11 on page 15](#)). Assuming that the oscillator is running at exactly 32,768 Hz, each of the 31 increments in the calibration byte would represent +10.7 or –5.35 seconds per month which corresponds to a total range of +5.5 or –2.75 minutes per month.

Two methods are available for ascertaining how much calibration a given M41T00S may require.

The first involves setting the clock, letting it run for a month and comparing it to a known accurate reference and recording deviation over a fixed period of time. Calibration values, including the number of seconds lost or gained in a given period, can be found in application note AN934, “TIMEKEEPER® calibration.” This allows the designer to give the end user the ability to calibrate the clock as the environment requires, even if the final product is packaged in a non-user serviceable enclosure. The designer could provide a simple utility that accesses the calibration byte.

The second approach is better suited to a manufacturing environment, and involves the use of the FT/OUT pin. The pin will toggle at 512 Hz, when the Stop bit (ST, D7 of 00h) is '0,' and the Frequency Test bit (FT, D6 of 07h) is '1.'

Any deviation from 512 Hz indicates the degree and direction of oscillator frequency shift at the test temperature. For example, a reading of 512.010124 Hz would indicate a +20 ppm oscillator frequency error, requiring a –10 (XX001010) to be loaded into the calibration byte for correction. Note that setting or changing the calibration byte does not affect the frequency test output frequency.

The FT/OUT pin is an open drain output which requires a pull-up resistor to V_{CC} for proper operation. A 500-10k resistor is recommended in order to control the rise time. The FT bit is cleared on power-down.

Note: The Frequency test is not available in battery mode.

Figure 10. Crystal accuracy across temperature

Figure 11. Clock calibration

3.2.1 Century bit

Bits D7 and D6 of clock register 02h contain the CENTURY ENABLE bit (CEB) and the CENTURY bit (CB). Setting CEB to a '1' will cause CB to toggle, either from a '0' to '1' or from '1' to '0' at the turn of the century (depending upon its initial state). If CEB is set to a '0,' CB will not toggle.

3.2.2 Oscillator fail detection

If the Oscillator Fail bit (OF) is internally set to '1,' this indicates that the oscillator has either stopped, or was stopped for some period of time and can be used to judge the validity of the clock and date data.

In the event the OF bit is found to be set to '1' at any time other than the initial power-up, the STOP bit (ST) should be written to a '1,' then immediately reset to '0.' This will restart the oscillator.

The following conditions can cause the OF bit to be set:

- The first time power is applied (defaults to a '1' on power-up).
- The voltage present on V_{CC} is insufficient to support oscillation.
- The ST bit is set to '1.'
- External interference of the crystal.

The OF bit will remain set to '1' until written to logic '0.' The oscillator must start and have run for at least 4 seconds before attempting to reset the OF Bit to '0.'

3.2.3 Output driver pin

When the FT bit is not set, the FT/OUT pin becomes an output driver that reflects the contents of D7 of the calibration register. In other words, when D7 (OUT bit) and D6 (FT bit) of address location 07h are a '0,' then the FT/OUT pin will be driven low.

Table 3. FT/OUT pin status

Power mode	(FT) D6 of 07h	(OUT bit) D7 of 07h	Status
VCC Mode	0	0	Low
	0	1	High
	1	1 or 0	Frequency Test
Battery Mode	N.A.	N.A.	High

Note: The FT/OUT pin is an open drain which requires an external pull-up resistor.

3.2.4 Preferred initial power-on default

Upon initial application of power to the device, the ST and FT bits are set to a '0' state, and the OF and OUT bits will be set to a '1.' All other register bits will initially power-on in a random state (see [Table 4](#)).

Table 4. Preferred default values

Condition	ST	Out	FT	OF
Initial power-up ⁽¹⁾	0	1	0	1
Subsequent power-up (with battery backup) ⁽²⁾	UC	UC	0	UC

1. State of other control bits undefined.

2. UC = Unchanged

4 Maximum ratings

Stressing the device above the rating listed in the absolute maximum ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 5. Absolute maximum ratings

Sym	Parameter	Value	Unit
T _{STG}	Storage temperature (V _{CC} off, oscillator off)	–55 to 125	°C
V _{CC}	Supply voltage	–0.3 to 7	V
T _{SLD} ⁽¹⁾	Lead solder temperature for 10 seconds	260	°C
V _{IO}	Input or output voltages	–0.3 to V _{CC} +0.3	V
I _O	Output current	20	mA
P _D	Power dissipation	1	W

1. Reflow at peak temperature of 260 °C (total thermal budget not to exceed 245 °C for greater than 30 seconds).

Caution: Negative undershoots below -0.3 volts are not allowed on any pin while in the battery backup mode

5 DC and AC parameters

This section summarizes the operating and measurement conditions, as well as the DC and AC characteristics of the device. The parameters in the following DC and AC Characteristic tables are derived from tests performed under the Measurement Conditions listed in the relevant tables. Designers should check that the operating conditions in their projects match the measurement conditions when using the quoted parameters.

Table 6. Operating and AC measurement conditions

Parameter	M41T00S
Supply voltage (V_{CC})	2.7 to 5.5 V
Ambient operating temperature (T_A)	-40 to 85 °C
Load capacitance (C_L)	100 pF
Input rise and fall times	≤ 50 ns
Input pulse voltages	$0.2V_{CC}$ to $0.8V_{CC}$
Input and output timing ref. voltages	$0.3V_{CC}$ to $0.7V_{CC}$

Note: Output Hi-Z is defined as the point where data is no longer driven.

Figure 12. AC measurement I/O waveform

Table 7. Capacitance

Symbol	Parameter ⁽¹⁾⁽²⁾	Min	Max	Unit
C_{IN}	Input capacitance	-	7	pF
$C_{OUT}^{(3)}$	Output capacitance	-	10	pF
t_{LP}	Low-pass filter input time constant (SDA and SCL)	-	50	ns

1. Effective capacitance measured with power supply at 5V; sampled only, not 100% tested.
2. At 25 °C, $f = 1$ MHz
3. Outputs deselected.

Table 8. DC characteristics

Sym	Parameter	Test condition ⁽¹⁾	Min	Typ	Max	Unit
I _{LI}	Input leakage current	$0\text{ V} \leq V_{IN} \leq V_{CC}$			± 1	μA
I _{LO}	Output leakage current	$0\text{ V} \leq V_{OUT} \leq V_{CC}$			± 1	μA
I _{CC1}	Supply current	Switch freq = 400 kHz			300	μA
I _{CC2}	Supply current (standby)	SCL = 0 Hz All Inputs $\geq V_{CC} - 0.2\text{ V}$ $\leq V_{SS} + 0.2\text{ V}$			70	μA
V _{IL}	Input low voltage		-0.3		$0.3V_{CC}$	V
V _{IH}	Input high voltage		$0.7V_{CC}$		$V_{CC} + 0.3$	V
V _{OL}	Output low voltage	I _{OL} = 3.0 mA			0.4	V
	Output low voltage (open drain) ⁽²⁾	I _{OL} = 10 mA			0.4	V
	Pull-up supply voltage (open drain)	FT/OUT			5.5	V
V _{BAT} ⁽³⁾	Backup supply voltage		2.0		$3.5^{(4)}$	V
I _{BAT}	Battery supply current	T _A = 25 °C, V _{CC} = 0 V Oscillator ON, V _{BAT} = 3 V		0.6	1	μA

1. Valid for ambient operating temperature: T_A = -40 to 85 °C; V_{CC} = 2.7 to 5.5 V (except where noted).

2. For FT/OUT pin (open drain).

3. STMicroelectronics recommends the RAYOVAC BR1225 or BR1632 (or equivalent) as the battery supply.

4. For rechargeable backup, V_{BAT} (max) may be considered to be V_{CC}.

Table 9. Crystal electrical characteristics

Sym	Parameter ⁽¹⁾⁽²⁾	Min	Typ	Max	Unit
f _O	Resonant frequency		32.768		kHz
R _S	Series resistance			$60^{(3)}$	k Ω
C _L	Load capacitance		12.5		pF

1. Externally supplied if using the SO8 package. STMicroelectronics recommends the KDS DT-38: 1TA/1TC252E127, Tuning Fork Type (thru-hole) or the DMX-26S: 1TJS125FH2A212, (SMD) quartz crystal for industrial temperature operations. KDS can be contacted at kouhou@kdsj.co.jp or <http://www.kdsj.co.jp> for further information on this crystal type.

2. Load capacitors are integrated within the M41T00S. Circuit board layout considerations for the 32.768 kHz crystal of minimum trace lengths and isolation from RF generating signals should be taken into account.

3. For applications requiring backup supply operation below 2.5 V, R_S (max) should be considered 40 k Ω .

Figure 13. Power down/up mode AC waveforms

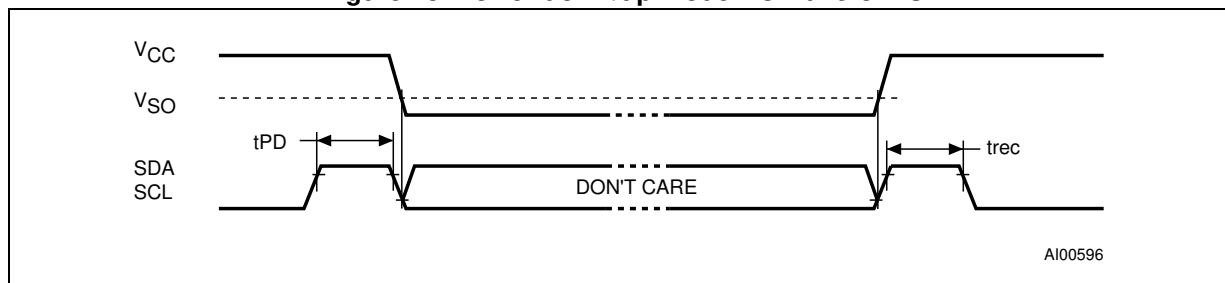

Table 10. Power down/up AC characteristics

Symbol	Parameter ⁽¹⁾⁽²⁾	Min	Typ	Max	Unit
t_{PD}	SCL and SDA at V_{IH} before power-down	0			ns
t_{rec}	SCL and SDA at V_{IH} after power-up	10			μ s

- V_{CC} fall time should not exceed 5 mV/ μ s.
- Valid for ambient operating temperature: $T_A = -40$ to 85 °C; $V_{CC} = 2.7$ to 5.5 V (except where noted).

Table 11. Power down/up trip points DC characteristics

Sym	Parameter ⁽¹⁾⁽²⁾	Min	Typ	Max	Unit
V_{PFD}	Power-fail deselect	2.5	2.6	2.7	V
	Hysteresis		25		mV
V_{SO}	Battery backup switchover voltage ($V_{CC} < V_{BAT}$; $V_{CC} < V_{PFD}$)	$V_{BAT} < V_{PFD}$	V_{BAT}		V
		$V_{BAT} > V_{PFD}$	V_{PFD}		V
	Hysteresis		40		mV

- All voltages referenced to V_{SS} .
- Valid for ambient operating temperature: $T_A = -40$ to 85 °C; $V_{CC} = 2.7$ to 5.5 V (except where noted).

tSU:STO	STOP condition setup time	600			ns
tBUF	Time the bus must be free before a new transmission can start	1.3			μs

1. Valid for ambient operating temperature: $T_A = -40$ to 85 °C; $V_{CC} = 2.7$ to 5.5 V (except where noted).
2. Transmitter must internally provide a hold time to bridge the undefined region (300 ns max) of the falling edge of SCL.

6 Package mechanical information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.

Figure 16. Carrier tape for SO8 (150 mils body width) package

Table 14. Carrier tape dimensions for SO8 (150 mils body width) package

Package	W	D	E	P ₀	P ₂	F	A ₀	B ₀	K ₀	P ₁	T	Unit	Bulk Qty
SO8	12.00 ±0.30	1.50 +0.10/ -0.00	1.75 ±0.10	4.00 ±0.10	2.00 ±0.10	5.50 ±0.05	6.50 ±0.10	5.30 ±0.10	2.20 ±0.10	8.00 ±0.10	0.30 ±0.05	mm	2500

Figure 17. Reel schematic

Table 15. Reel dimensions for 12 mm carrier tape - SO8 package (150 mils body width)

A (max)	B (min)	C	D (min)	N (min)	G	T (max)
330 mm (13-inch)	1.5 mm	13 mm ± 0.2 mm	20.2 mm	60 mm	12.4 mm $+ 2/-0$ mm	18.4 mm

Note: The dimensions given in [Table 15](#) incorporate tolerances that cover all variations on critical parameters.

7 Part numbering

Table 16. Ordering information scheme

Example:	M41T	00S	M	6	F
Device type					
M41T					
Supply voltage and write protect voltage					
00S = V _{CC} = 2.7 to 5.5 V					
Package					
M = SO8					
Temperature range					
6 = -40 °C to 85 °C					
Shipping method					
E = ECOPACK® package, tubes ⁽¹⁾					
F = ECOPACK® package, tape & reel					

1. Not recommended for new design. Contact local ST sales office for availability.

For other options, or for more information on any aspect of this device, please contact the ST sales office nearest you.

8 Revision history

Table 17. Document revision history

Date	Revision	Changes
10-Feb- 2004	0.1	First draft
20-Feb-2004	0.2	Update characteristics (Table 9, 10, 5, 7, 15)
14-Apr-2004	1.0	Product promoted; reformatted; update characteristics, including Lead-free package information (Figure 4, 10; Table 4, 11, 15)
05-May-2004	1.1	Update DC characteristics (Table 7)
16-Jun-2004	1.2	Added package shipping (Table 15)
13-Sep-2004	2.0	Update maximum ratings (Table 4)
26-Nov-2004	3.0	Promote document; update characteristics; remove references to SOX18 package (cover page, Figure 4; Table 16)
14-May-2008	4	Reformatted document; updated Section 6, Figure 1, 15, Table 1, 4, 12, 15
17-Oct-2011	5	Updated title, Features, ECOPACK® text in Section 6: Package mechanical information; added Figure 16, 17, Table 13, 14; added footnote 1 to Table 15: Ordering information scheme; minor textual updates
06-Oct-2021	6	Updated Section 2 Added note in Section 3.2 and new Table 3
01-Aug-2024	7	Updated features on the cover page

IMPORTANT NOTICE – PLEASE READ CAREFULLY

STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, enhancements, modifications, and improvements to ST products and/or to this document at any time without notice. Purchasers should obtain the latest relevant information on ST products before placing orders. ST products are sold pursuant to ST's terms and conditions of sale in place at the time of order acknowledgement.

Purchasers are solely responsible for the choice, selection, and use of ST products and ST assumes no liability for application assistance or the design of Purchasers' products.
