

# 28 V Rated OVLO/UVLO Controller with Negative Stress Protection

## FPF2260ATMX

### Description

FPF2260ATMX is an OVP and UVLO controller with reverse / negative voltage protection. The device controls and drives a pair of external N-MOSFET that can operate over an input voltage range of 2.8 V to 23 V. In that way, with OVP feature implemented, the system can allow huge current as long as the external MOSFET can handle.

When the input voltage exceeds the over-voltage threshold or lower than under-voltage threshold, the external FET is turned off immediately to prevent damage to the protected downstream components.

When the input voltage is stressed a negative voltage, the external FET will also be turned off and prevent OUT dropping to negative voltage.

FPF2260ATMX is available in a small X2QFN12 package and operate over the free-air temperature range of  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ .

### Features

- Over-voltage Protection Up to  $\pm 28\text{V}$
- Programmable Over-voltage Lockout (OVLO)
  - ♦ Externally Adjustable via OVLO Pin
  - ♦ Default OVLO Level without Additional Components
- Programmable Under-voltage Lockout (UVLO)
  - ♦ Externally Adjustable via UVLO Pin
- Active-high Enable Pin (EN) for Device
- Super-fast OVLO Response Time: Typical 150 ns
- Negative Voltage Blocking
- Short Circuit Protection and Auto-restart
- Selectable Gate Driver Voltage
- USB OTG Support Mode
- Open-Drain Output Indicators
  - ♦ OVFLGB for Over Voltage Stress
  - ♦ UVFLAG for Under Voltage Lockout
- Robust ESD Performance
  - ♦ 2 kV Human Body Model (HBM)
  - ♦ 1 kV Charged Device Model (CDM)

### Typical Applications

- Mobile Phones
- PDAs
- Notebooks
- Desktops

## FUNCTION DESCRIPTION

### General

FPF2260A is an OVP controller to drive external N-type MOSFETs. The device can protect next stage system which is optimized to lower voltage working condition, especially with ultra-high charging current. The device includes multi-functions including OVP, Advanced TRCB, and Negative Stress protection.

### Power MOSFET Driver

The FPF2260A integrates charge pump driver to control external N-type MOSFET pair. The drive voltage can be configured by GPIO for different MOSFET.

The drive voltage for MOSFET can be configured by GPIO pin GT\_CON.  $V_{GS}$  could be set to 6 V by pull GT\_CON to high or floating. Or,  $V_{GS}$  will be set to 12 V by pulling GT\_CON to ground.

### True Reverse Current Blocking and USB OTG

The FPF2260A support advanced TRCB mode by pulling TRCB pin to high or floating it. In the advanced TRCB mode, no reverse current will be seen from OUT to IN through the external MOSFETs if  $V_{OUT} - V_{IN} > 30$  mV.

When advanced TRCB mode is active, OTG operation is not supported. If OTG is needed, TRCB pin needs to be pulled down to ground.

### Enable Control

The GPIO EN is an active high control pin. When the voltage is pulled low, FPF2260A will disable the external MOSFETs by connecting GT1 to IN and GT2 to OUT.

When EN is logic high, FPF2260A will close external MOSFET if there are no over stressed condition.

### Under Voltage Lockout

FPF2260A will turn the FETs off when the voltage on IN is lower than the UVLO threshold  $V_{IN\_UVLO}$ .

Whenever IN voltage ramps up to higher than the threshold, the power FET will be turned on automatically after  $t_{DEB}$  de-bounce time if there is no other over stressed condition.

The external resistor ladder can be decided according to the following equation:

$$V_{IN\_UVLO} = V_{UVLO\_TH} \times [1 + R1 / (R2 + R3)] \quad (\text{eq. 1})$$

where R1, R2 and R3 are the resistors in figure 1.

### Over Voltage Lockout

The power FET will be turned off whenever IN voltage higher than  $V_{IN\_OVLO}$ . The value of  $V_{IN\_OVLO}$  can be set by external resistor ladder or just be default value  $V_{IN\_OVLO}$ .

When  $V_{OVLO} \leq 0.3$  V,  $V_{OVLO}$  is decided by default value. When  $V_{OVLO} > 0.3$  V, the power switch will be turned off once  $V_{OVLO} > V_{OVLO\_TH}$ . The external resistor ladder can be decided according to the following equation:

$$V_{IN\_OVLO} = V_{OVLO\_TH} \times [1 + (R1 + R2) / R3] \quad (\text{eq. 2})$$

where R1, R2 and R3 are the resistors in figure 1.

### Negative Voltage Protection

FPF2260 support negative voltage protection to help system avoid unexpected negative stress. The gate of first external power FET, GT1, will be pulled down with the voltage on IN when it is negative. This behavior can keep the external FET at off status till -28 V.

## APPLICATIONS INFORMATION

### Input Decoupling ( $C_{in}$ )

A ceramic or tantalum at least 0.1  $\mu$ F capacitor is recommended and should be put before and close the connection point of MOSFET and FPF2260A IN. Higher capacitance and lower ESR will improve the overall line and load transient response.

### Output Decoupling ( $C_{out}$ )

The FPF2260A is a stable component and does not require a minimum Equivalent Series Resistance (ESR) for the output capacitor. The minimum output decoupling value is 0.1  $\mu$ F and can be augmented to fulfill stringent load transient requirements.

### Hints for PCB Layout

The external MOSFET is an important part to FPF2260A. The connection of gate should be as short as possible to avoid parasitic resistance and inductance for better OVP performance.
