description

The TLC0820AC and the TLC0820AI are Advanced LinCMOS™ 8-bit analog-to-digital converters each consisting of two 4-bit flash converters, a 4-bit digital-to-analog converter, a summing (error) amplifier, control logic, and a result latch circuit. The modified flash technique allows low-power integrated circuitry to complete an 8-bit conversion in 1.18 μs over temperature. The on-chip track-and-hold circuit has a 100-ns sample window and allows these devices to convert continuous analog signals having slew rates of up to 100 mV/μs without external sampling components. TTL-compatible 3-state output drivers and two modes of operation allow interfacing to a variety of microprocessors. Detailed information on interfacing to most popular microprocessors is readily available from the factory.

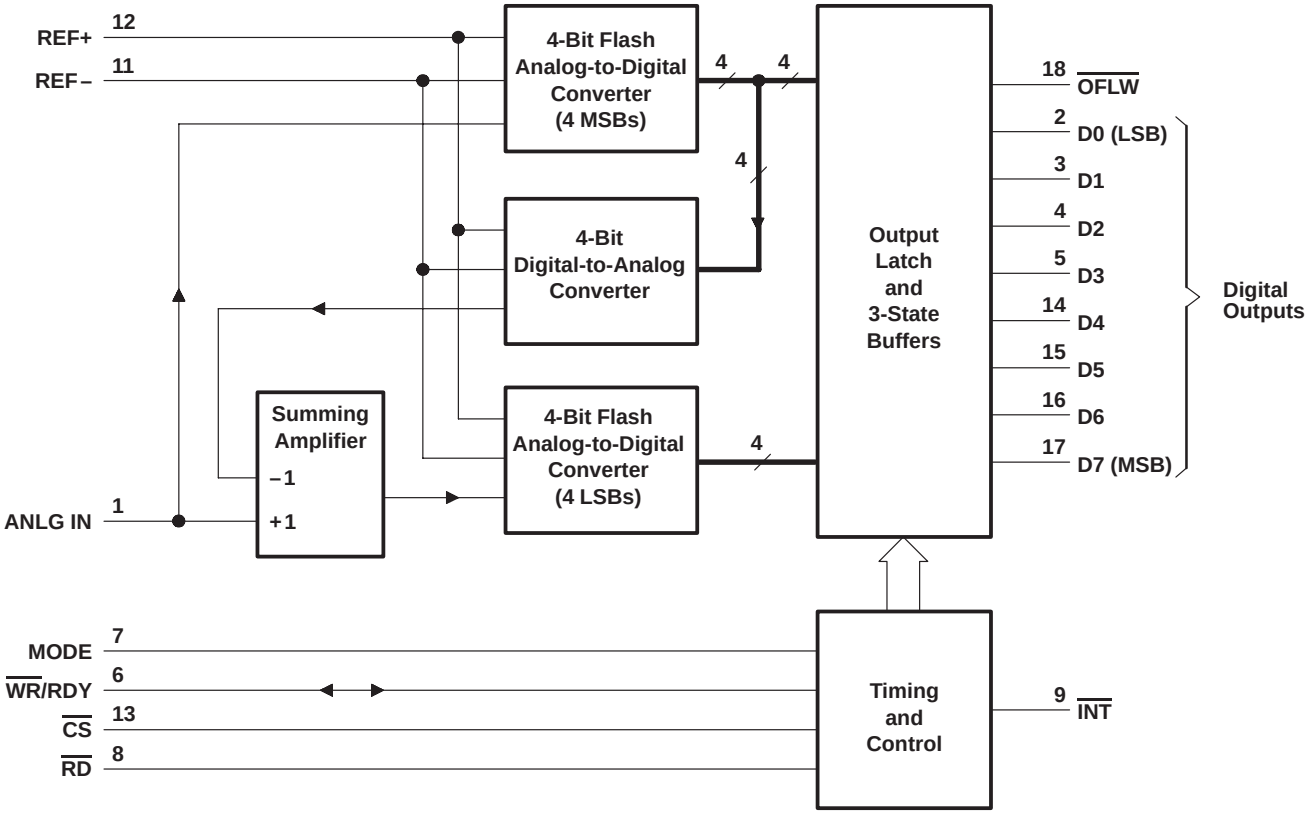
functional block diagram



Terminal Functions

TERMINAL NAME	TERMINAL NO.	I/O	DESCRIPTION
ANLG IN	1	I	Analog input
$\overline{CS}$	13	I	Chip select. $\overline{CS}$ must be low in order for $\overline{RD}$ or $\overline{WR}$ to be recognized by the ADC.
D0	2	O	Digital, 3-state output data, bit 1 (LSB)
D1	3	O	Digital, 3-state output data, bit 2
D2	4	O	Digital, 3-state output data, bit 3
D3	5	O	Digital, 3-state output data, bit 4
D4	14	O	Digital, 3-state output data, bit 5
D5	15	O	Digital, 3-state output data, bit 6
D6	16	O	Digital, 3-state output data, bit 7
D7	17	O	Digital, 3-state output data, bit 8 (MSB)
GND	10		Ground
$\overline{INT}$	9	O	Interrupt. In the write-read mode, the interrupt output ($\overline{INT}$) going low indicates that the internal count-down delay time, $t_{d(int)}$, is complete and the data result is in the output latch. The delay time $t_{d(int)}$ is typically 800 ns starting after the rising edge of $\overline{WR}$ (see operating characteristics and Figure 3). If $\overline{RD}$ goes low prior to the end of $t_{d(int)}$, $\overline{INT}$ goes low at the end of $t_{d(RL)}$ and the conversion results are available sooner (see Figure 2). $\overline{INT}$ is reset by the rising edge of either $\overline{RD}$ or $\overline{CS}$.
MODE	7	I	Mode select. MODE is internally tied to GND through a 50-μA current source, which acts like a pulldown resistor. When MODE is low, the read mode is selected. When MODE is high, the write-read mode is selected.
NC	19		No internal connection
$\overline{OFLW}$	18	O	Overflow. Normally $\overline{OFLW}$ is a logical high. However, if the analog input is higher than V_{ref+}, $\overline{OFLW}$ will be low at the end of conversion. It can be used to cascade two or more devices to improve resolution (9 or 10 bits).
$\overline{RD}$	8	I	Read. In the write-read mode with $\overline{CS}$ low, the 3-state data outputs D0 through D7 are activated when $\overline{RD}$ goes low. $\overline{RD}$ can also be used to increase the conversion speed by reading data prior to the end of the internal count-down delay time. As a result, the data transferred to the output latch is latched after the falling edge of $\overline{RD}$. In the read mode with $\overline{CS}$ low, the conversion starts with $\overline{RD}$ going low. $\overline{RD}$ also enables the 3-state data outputs on completion of the conversion. RDY going into the high-impedance state and $\overline{INT}$ going low indicate completion of the conversion.
REF–	11	I	Reference voltage. REF– is placed on the bottom of the resistor ladder.
REF+	12	I	Reference voltage. REF+ is placed on the top of the resistor ladder.
V_{CC}	20		Power supply voltage
$\overline{WR}$/RDY	6	I/O	Write ready. In the write-read mode with $\overline{CS}$ low, the conversion is started on the falling edge of the $\overline{WR}$ input signal. The result of the conversion is strobed into the output latch after the internal count-down delay time, $t_{d(int)}$, provided that the $\overline{RD}$ input does not go low prior to this time. The delay time $t_{d(int)}$ is approximately 800 ns. In the read mode, RDY (an open-drain output) goes low after the falling edge of $\overline{CS}$ and goes into the high-impedance state when the conversion is strobed into the output latch. It is used to simplify the interface to a microprocessor system.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage, V_{CC} (see Note 1) . . . . . 10 V
Input voltage range, all inputs (see Note 1) . . . . . –0.2 V to V_{CC}+0.2 V
Output voltage range, all outputs (see Note 1) . . . . . –0.2 V to V_{CC}+0.2 V
Operating free-air temperature range: TLC0820AC . . . . . 0°C to 70°C
TLC0820AI . . . . . –40°C to 85°C
Storage temperature range . . . . . –65°C to 150°C
Case temperature for 10 seconds: FN package . . . . . 260°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds: DB, DW or N package . . . . . 260°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltages are with respect to network GND.

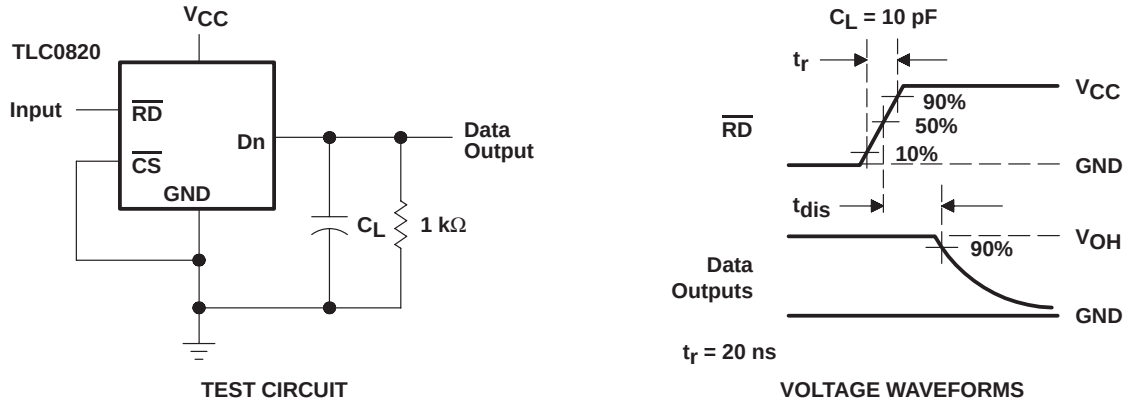

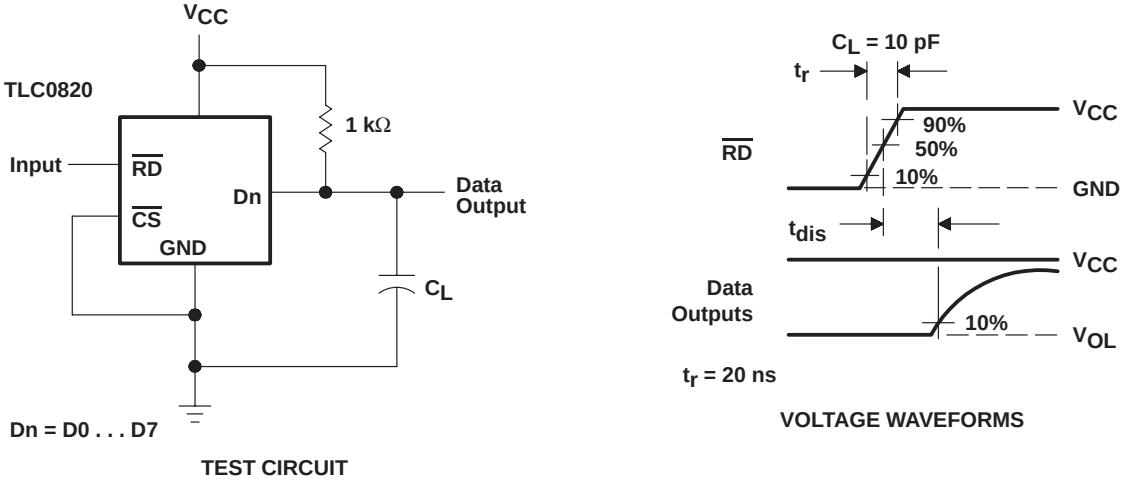

Figure 5. Test Circuit and Voltage Waveforms

PRINCIPLES OF OPERATION

The TLC0820AC and TLC0820AI each employ a combination of sampled-data comparator techniques and flash techniques common to many high-speed converters. Two 4-bit flash analog-to-digital conversions are used to give a full 8-bit output.

The recommended analog input voltage range for conversion is –0.1 V to V_{CC} + 0.1 V. Analog input signals that are less than V_{ref-} + 1/2 LSB or greater than V_{ref+} – 1/2 LSB convert to 00000000 or 11111111, respectively. The reference inputs are fully differential with common-mode limits defined by the supply rails. The reference input values define the full-scale range of the analog input. This allows the gain of the ADC to be varied for ratiometric conversion by changing the V_{ref+} and V_{ref-} voltages.

The device operates in two modes, read (only) and write-read, that are selected by MODE. The converter is set to the read (only) mode when MODE is low. In the read mode, $\overline{WR}$/RDY is used as an output and is referred to as the ready terminal. In this mode, a low on $\overline{WR}$/RDY while $\overline{CS}$ is low indicates that the device is busy. Conversion starts on the falling edge of $\overline{RD}$ and is completed no more than 2.5 μs later when $\overline{INT}$ falls and $\overline{WR}$/RDY returns to the high-impedance state. Data outputs also change from high-impedance to active states at this time. After the data is read, $\overline{RD}$ is taken high, $\overline{INT}$ returns high, and the data outputs return to their high-impedance states.

When MODE is high, the converter is set to the write-read mode and $\overline{WR}$/RDY is referred to as the write terminal. Taking $\overline{CS}$ and $\overline{WR}$/RDY low selects the converter and initiates measurement of the input signal. Approximately 600 ns after $\overline{WR}$/RDY returns high, the conversion is completed. Conversion starts on the rising edge of $\overline{WR}$/RDY in the write-read mode.

The high-order 4-bit flash ADC measures the input by means of 16 comparators operating simultaneously. A high-precision 4-bit DAC then generates a discrete analog voltage from the result of that conversion. After a time delay, a second bank of comparators does a low-order conversion on the analog difference between the input level and the high-order DAC output. The results from each of these conversions enter an 8-bit latch and are output to the 3-state output buffers on the falling edge of $\overline{RD}$.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES “AS IS” AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI’s products are provided subject to TI’s Terms of Sale or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI’s provision of these resources does not expand or otherwise alter TI’s applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
