## FEATURES

- Input Power Voltage:  $24V \pm 1V$
- Input Current Range: 35mA to 180mA
- Output Voltage: 0 to 3kV@CTRL = 0 to 5V
- Max. Output Current: 1mA
- Reference Voltage:  $5V \pm 0.05V$
- Input Control Voltage: 0 to 5V
- Full Span Modulation on Output Voltage
- Electronic Shutdown Control

## APPLICATIONS

This power module, AHV24V3KV1MAW, is designed for achieving DC-DC conversion from low voltage to high voltage as a power supply source which is widely used in scientific research and other fields including:

- X-ray Machine
- Spectral Analysis
- Nondestructive Inspection
- Semiconductor Manufacturing Equipment
- CRT Monitor Test
- Particle Accelerator
- Capillary Electrophoresis
- Particles Injection
- Semiconductor Technology
- Physical Vapor Phase Deposition
- Radio Frequency Amplification
- Electrospinning Preparation of Nanofiber
- Glass / Fabric Coating
- DC Reactive Magnetron Sputtering
- Cyclotron Accelerator

## DESCRIPTION

Figure 1 shows the actual pictures of AHV24V3KV1MAW. Figure 2 shows its connecting wires. More detail information is given in Table 1. The high voltage output can be set to a constant value between 0V to 3kV by connecting the CTRL port to the central tap of a POT (Potentiometer) or modulated by an AC signal ranging from 0V to 5V, as see Figure 3 and Figure 4 respectively. The output voltage equals to 600 times the input control voltage:  $V_{\text{OUT}} = 600 \times V_{\text{CTRL}}$ .

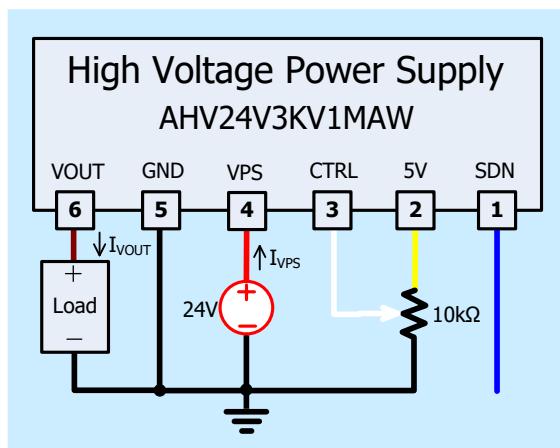

Figure 3. Setting Output to be a Constant Voltage

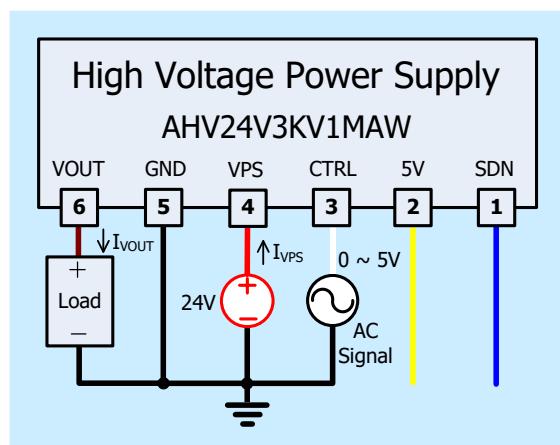

Figure 4. Modulating Output by an AC Signal Source

Please note that the modulation signal must have a low frequency  $\leq 10\text{Hz}$  and the value range must be  $0\text{V} \leq V_{\text{CTRL}} \leq 5\text{V}$ . The equivalent input circuit for the CTRL is shown in Figure 5.

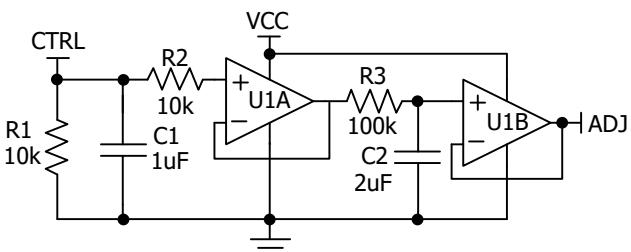

Figure 5. The Equivalent Circuit for CTRL Port

To shutdown AHV24V3KV1MAW, pull down SDN pin to  $<0.8\text{V}$ ; to turn it on, leave SDN pin unconnected or pull it  $>1.2\text{V}$ . The maximum voltage allowed on the SDN pin is 5V. The equivalent circuit for SDN port is shown in Figure 6.

## USING AHV24V3KV1MAW

This high voltage power supply must be mounted tightly onto a metal plate, ideally, thus expanding its heating sinking capacity of the metal enclosure. Sufficient ventilation must be provided to keep the power supply surface temperature under 55°C.

## SAFETY PRECAUTIONS

Although AHV24V3KV1MAW high voltage power supply comes with an over current protection circuit, a short circuit at the output should always be avoided. Make sure the high voltage wire for connecting VOUT node has sufficient insulation capability with its surrounding objects.

$VOUTP = N \times VCTRL$ , where  $N$  is the amplification factor:  $N = R_1/R_2$ .

## TESTING DATA

Test conditions:  $V_{VPS} = 24V$ ,  $T_A = 25^\circ C$ ,  $R_{LOAD} = 3M\Omega$

### DC Testing

The measured output voltage,  $V_{VOUT}$ , corresponding to the control port input voltage,  $V_{CTRL}$ , is shown in Figure 7.

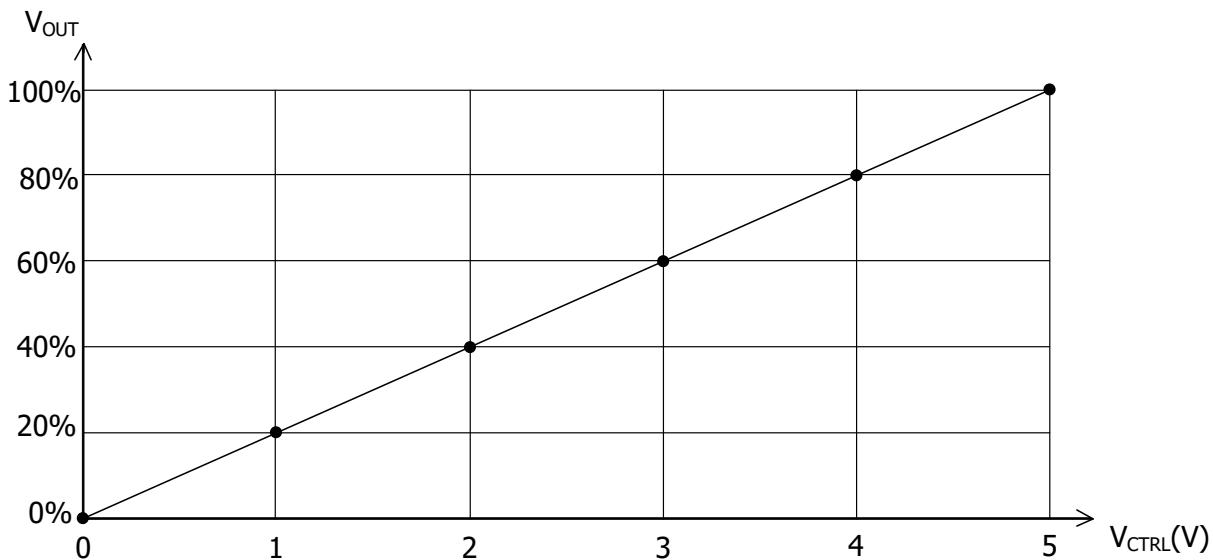

Figure 7.  $V_{CTRL}$  vs.  $V_{VOUT}$

### AC Testing

To test the analog modulation function, a triangle and sine-wave voltage signals are applied to the CTRL port as the input source signal respectively. Figure 8 and 9 show both the input signal and the output signal waveforms when using the triangle and sine-wave signals at the CTRL port respectively.

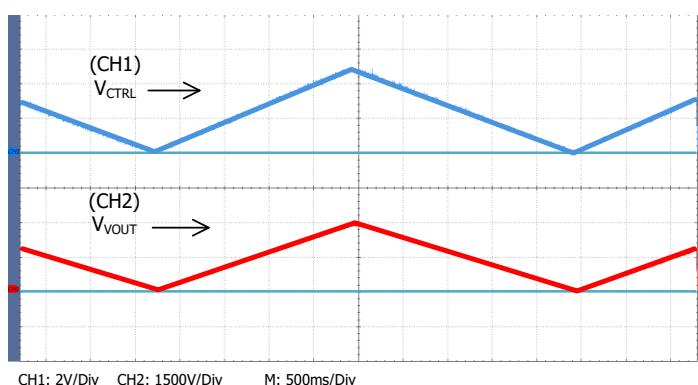

Figure 8. Triangle Wave Modulation

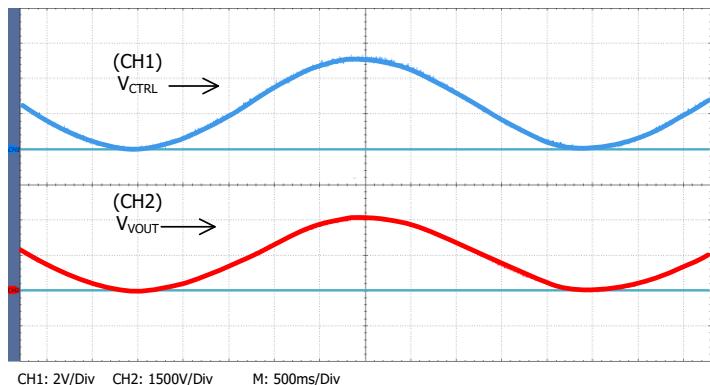

Figure 9. Sine Wave Modulation

To test the rise and fall times at the output, a step function signal is applied to the CTRL port. The testing results are shown in Figure 10, Figure 11, and Figure 12. As shown in Figure 11 and Figure 12, a square wave of  $0.25V \sim 5V$ ,  $f = 0.10Hz$ , is applied to CTRL port, the output waveform fall time is measured to be about 100ms and the rise time is about 50ms. These two values are not the same, that is because on the rising trail, the power supply injects a current to the load; while on the falling trail, the best the power supply can do is to stop its output current and let the load resistor drain the output filtering capacitor to a lower voltage, and the draining current is much smaller than the injection current.

10. Despite operating the electronic modules as specified, malfunctions or failures may occur before the end of their usual service life due to the current state of technology. Therefore, it is crucial for customer applications that require a high level of operational safety, especially in accident prevention or life-saving systems where the malfunction or failure of electronic modules could pose a risk to human life or health, to ensure that suitable measures are taken. The customer should design their application or implement protective circuitry or redundancy to prevent injury or damage to third parties in the event of an electronic module malfunction or failure.
