

450 mA non-isolated high-voltage buck evaluation board using CoolSET™ ICE5BR4780BZ-1

EVAL_5BR4780BZ-1_450mA1

About this document

Scope and purpose

This document describes a non-isolated 15 V/450 mA high-voltage buck converter using the latest CoolSET™ 5th Generation Fixed Frequency Plus ICE5BR4780BZ-1 enhanced switching controller from Infineon. The document contains power supply specifications, schematics, BOM, PCB layout and performance data. This evaluation board is designed to evaluate the performance of CoolSET™ ICE5BR4780BZ-1 switching controller and its ease of use.

Intended audience

This document is intended for SMPS design/application engineers, students, etc., who wish to design low-cost and non-isolated buck converters, for applications such as auxiliary power supplies for white goods, smart metering etc.

CoolSET™

Infineon's CoolSET™ AC-DC integrated power stages in fixed-frequency switching scheme offers increased robustness and outstanding performance. This family offers superior energy efficiency, comprehensive protective features, and reduced system costs and is ideally suited for auxiliary power supply applications in a wide variety of potential applications such as:

1 Introduction

This document describes a 15 V/450 mA evaluation board designed in a buck converter topology using the CoolSET™ 5th Generation Fixed Frequency Plus ICE5BR4780BZ-1 switching controller. ICE5BR4780BZ-1 is targeted at auxiliary power supplies for white goods, PCs, servers and TVs, or enclosed adapters, gaming consoles, smart metering, etc.

The CoolMOS™ 800 V SJ MOSFET integrated into this IC greatly simplifies the design and layout of the PCB. The new improved digital frequency reduction and frequency jitter feature offer lower EMI and higher efficiency. The enhanced active burst mode (ABM) power enables flexibility in standby power operation range selection. In addition, numerous adjustable protection functions have been implemented in ICE5BR4780BZ-1 to protect the system and customize the IC for the chosen application.

This document describes the list of features, power supply specifications, schematics, BOM, and performance data. Typical operating characteristics such as performance curves and scope waveforms are provided at the end of this document.

Figure 2 **EVAL_5BR4780BZ-1_450mA1**

4 Circuit description

4.1 Line input

The AC line input stage comprises an input fuse (F1), varistor (VAR1), X-capacitor (C1), rectifier diode bridge (D1), capacitors (C2 and C3), and inductor (L1). The X-capacitor (C1) and π -filter (C2, L1, and C3) act as EMI suppressors.

4.2 Start-up

The CoolSET™ ICE5BR4780BZ-1 switching controller uses a cascode structure to fast-charge the V_{CC} capacitor. Pull-up resistor (R1) connected to the GATE pin (pin 4) is used to initiate the start-up phase. When V_{VCC} reaches the turn-on voltage threshold 16 V, the IC begins with a soft-start. The soft-start implemented in ICE5BR4780BZ-1 is a digital time-based function. The preset soft-start time is 12 ms with four steps.

If not limited by other functions, the peak voltage on the CS pin will increase in increments from 0.3 V to 0.8 V. After the IC turn-on, the V_{CC} voltage is supplied by the output voltage. V_{CC} short-to-GND protection is implemented during the startup time.

4.3 Integrated MOSFET and PWM control

The CoolSET™ ICE5BR4780BZ-1 switching controller comprises a power MOSFET and a controller that simplify the circuit layout and reduce the PCB manufacturing cost. ICE5BR4780BZ-1 together with the MOSFET is placed at the high side of the converter with a floating ground at the cathode of the freewheeling diode (D4). An ultra-fast recovery diode (D4) is used to allow the inductor demagnetizing current to flow through it and limit the spike current through the power MOSFET, especially when the buck converter operates in continuous conduction mode (CCM). Therefore, the output voltage is sensed only during the freewheeling diode conduction time.

4.4 Output stage

The maximum output voltage ripple is determined by the output capacitance and the equivalent series resistance (ESR) of the output capacitor. Selection of a low ESR capacitor helps reduce the ripple. The dummy load resistor (R9) helps in output voltage regulation at light-load condition.

4.5 Feedback control

ICE5BR4780BZ-1 integrates a transconductance amplifier for feedback control. The output is sensed by the voltage divider (R4 and R5) and compared with an internal reference voltage at the VERR pin. An external compensation network (C4, C5, and R2) is recommended on the FB pin to control the output voltage.

4.6 Primary-side peak-current control

The MOSFET drain-source current is sensed via external resistors (R7 and R8). ICE5BR4780BZ-1 is a current mode controller that has a cycle-by-cycle primary current and FB voltage control which ensures that the converter's maximum power is controlled in every switching cycle. To avoid mistripping caused by the MOSFET switch-on transient voltage spikes, a leading-edge blanking (LEB) time (t_{CS_LEB}) is integrated into the current sensing (CS) path.

4.7 Frequency reduction

Frequency reduction is implemented in ICE5BR4780BZ-1 to achieve better efficiency during light load. At light-load conditions, the reduced switching frequency (F_{SW}) improves the efficiency by reducing the switching losses. When load decreases, V_{FB} and F_{SW} decrease. Typically, F_{SW} at high load is 65 kHz and starts to decrease at $V_{FB} = 1.7$ V. There is no further frequency reduction once it reaches the f_{OSC_MIN} even if the load is further reduced.

Figure 3 Frequency reduction curve

4.8 Active burst mode (ABM)

The ABM entry and exit power levels (two levels) can be selected in ICE5BR4780BZ-1. See the product datasheet [\[1\]](#) for more details. ABM power level 3 is used in this evaluation board ($R3 = \text{open}$).

4.9 Protection features

ICE5BR4780BZ-1 provides comprehensive protection features to ensure a safe operation of the system. This includes V_{CC} overvoltage (OV) and undervoltage (UV), overload, overtemperature (controller junction) and V_{CC} short-to-GND. When those faults are detected, the system enters protection mode. Once the fault is removed, the system resumes normal operation.

Test results

7.5 Conducted emissions (EN 55022 Class B)

Conducted EMI was measured by Schaffner (SMR4503) EMI measuring receiver and followed the test standard of EN 55022 (CISPR 22) Class B. The evaluation board is connected to a resistive load (450 mA) with an input voltage of 115 V AC and 230 V AC.

Passed with 6 dB margin for quasi-peak measurement at low-line (115 V AC).

Figure 9 Conducted emissions at 115 V AC with full load

Passed with 6 dB margin for quasi-peak measurement at high-line (230 V AC).

9 Design example A

In this evaluation board, there is a component placeholder for two low dropout (LDO) regulators connected in series as shown in Figure 19. The 12 V output regulated by IC2 is capable of supplying up to 250 mA. The 5 V output regulated by IC3 is capable of supplying up to 100 mA.

Figure 19 Additional circuit for design example A

Note: Components in the additional circuit shown in Figure 19 are not mounted on the evaluation board.

9.1 Specification of design example A

Because 12 V output and 5 V output are derived from the main output (15 V), the total output current must not exceed the maximum capacity of the main output current. The specification of this design example is shown in Table 6.

Table 6 Specification of design example A

Description	Symbol	Value	Comments
Output voltage 1	V_{O1}	15 V	Main output
Max. output current 1	I_{O1}	0.1 A	–
Output voltage 2 (via LDO)	V_{O2}	12 V	Derived from 15 V output
Max. output current 2	I_{O2}	0.25 A	–
Output voltage 3 (via LDO)	V_{O3}	5 V	Derived from 12 V output
Max. output current 3	I_{O3}	0.1 A	

9.2 Full-load efficiency

Additional power loss caused by LDO circuits reduces the overall efficiency.

Table 7 Full load efficiency – example A

Input (V AC/Hz)	P _{IN} (W)	V _{O1} (V DC)	I _{O1} (A)	V _{O2} (V DC)	I _{O2} (A)	V _{O3} (V DC)	I _{O3} (A)	P _{OUT} (W)	Efficiency η (%)
