

Features

- 6 Bit Digital Phase Shifter
- 360° Coverage with LSB = 5.625°
- Integrated Driver
- Serial or Parallel Control
- Low DC Power Consumption
- Minimal Attenuation Variation over Phase Shift Range
- 50 Ω Impedance
- EAR99
- Lead-Free 4 mm 24-Lead PQFN Package
- RoHS* Compliant

Applications

- Multi Market

Description

The MAPS-011019 is a GaAs pHEMT 6-bit digital phase shifter with an integrated driver in a lead-free 4 mm PQFN plastic surface mount package. The step size is 5.625° providing phase shift from 0° to 360° steps. This design has been optimized to minimize variation in attenuation over the phase shift range.

The MAPS-011019 is ideally suited for use where high phase accuracy with minimum loss variation over the phase shift range is required. The 4 mm PQFN package provides a smaller footprint than is typically available for a wideband digital phase shifter with an internal driver. Typical applications include 5G and test equipment.

2. The exposed pad centered on the package bottom must be connected to RF, DC and thermal ground.
3. Unused logic controls must be grounded.
4. MACOM recommends connecting unused package pins (N/C) to ground
5. RF_{IN} and RF_{OUT} are DC-coupled to ground and AC matched to 50 Ω. DC blocking capacitors are not necessary if the RF line DC potential is ground.

Handling Procedures

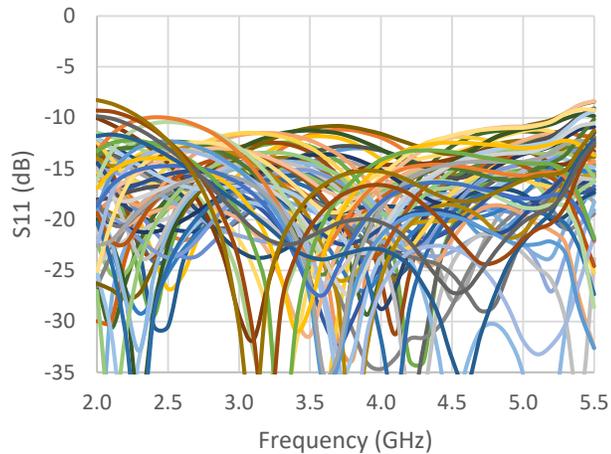

Please observe the following precautions to avoid damage:

Static Sensitivity

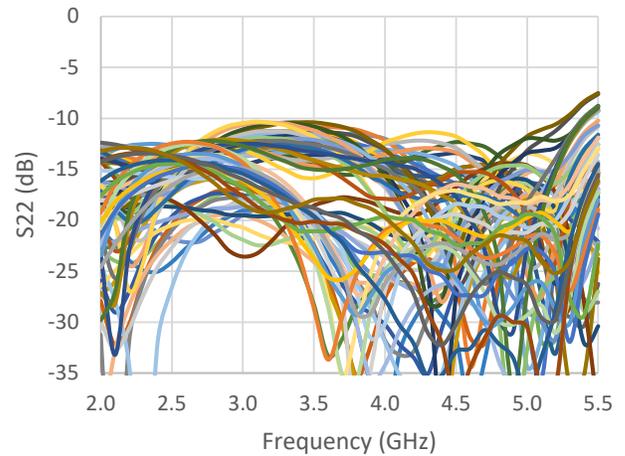

These electronic devices are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these HBM Class 1C devices.

Modes of Operation: Serial and Direct Parallel

Bias Sequencing for both Modes

To avoid potential problems with application of supplies with floating controls, known logic levels (preferably 0 V) should be applied to the controls before the VDD and VEE are supplied. One easy way to do this is with pull down resistors. VDD and VEE can be applied in either order.

Serial Mode

The serial control interface (SERIN, CLK, LE, SEROUT) is compatible with the SPI protocol. SPI mode is activated when P/S is kept high. The 6-bit serial word must be loaded with the MSB first. After shifting in the 6 bit word, a rising edge on LE will set the phase shifter to the desired state. While LE is high the CLK is masked to protect the data while implementing the change. SEROUT is SERIN delayed by 6 clock cycles.

When P/S is low, the serial control interface is disabled. When P/S is set high, pins 22, 23, and 24 have the LE, CLK, and SER IN function.

In serial mode operation, the outputs will stay constant while LE is kept low.

Direct Parallel Mode

The parallel mode is enabled when P/S is set low. In the direct parallel mode, the phase shifter is controlled by the parallel control inputs directly. When P/S is set low, pins 22, 23, and 24 have the D3, D2, and D1 function.
