

Multiprotocol wireless 32-bit MCU Arm[®]-based Cortex[®]-M4 with FPU, Bluetooth[®] 5.4 radio solution

Datasheet - production data

Features

- Include ST state-of-the-art patented technology
 - Radio
 - 2.4 GHz
 - RF transceiver supporting Bluetooth[®] 5.4 specification
 - RX sensitivity: -95.5 dBm (Bluetooth[®] Low Energy at 1 Mbps)
 - Programmable output power up to +4 dBm with 1 dB steps
 - Integrated balun to reduce BOM
 - Support for 1 Mbps
 - Support GATT caching
 - Support EATT (enhanced ATT)
 - Dedicated Arm[®] 32-bit Cortex[®] M0+ CPU for real-time Radio layer
 - Accurate RSSI to enable power control
 - Suitable for systems requiring compliance with radio frequency regulations ETSI EN 300 328, EN 300 440, FCC CFR47 Part 15 and ARIB STD-T66
 - Support for external PA
 - Available integrated passive device (IPD) companion chip for optimized matching solution (MLPF-WB-01E3)
 - Ultra-low-power platform
 - 2.0 to 3.6 V power supply
 - -10 °C to +85 °C temperature range
 - 18 nA shutdown mode
 - 700 nA Standby mode + RTC + 48 KB RAM
 - Radio: Rx 7.7 mA / Tx at 0 dBm 8.6 mA
 - Core: Arm[®] 32-bit Cortex[®]-M4 CPU with FPU, adaptive real-time accelerator (ART Accelerator) allowing 0-wait-state execution from flash memory, frequency up to 64 MHz, MPU, 80 DMIPS, and DSP instructions
- 

UFQFPN48
7 x 7 mm
solder pad
- Performance benchmark
 - 1.25 DMIPS/MHz (Drystone 2.1)
 - 223.03 CoreMark[®] (3.48 CoreMark/MHz at 64 MHz)
 - Energy benchmark
 - 318 ULPMark[™] CP score
 - Supply and reset management
 - Ultra-safe, low-power BOR (brownout reset) with five selectable thresholds
 - Ultra-low-power POR/PDR
 - Programmable voltage detector (PVD)
 - V_{BAT} mode with RTC and backup registers
 - Clock sources
 - 32 MHz crystal oscillator with integrated trimming capacitors (Radio and CPU clock)
 - 32 kHz crystal oscillator for RTC (LSE)
 - Internal low-power 32 kHz RC (LSI1)
 - Internal low-drift 32 kHz (stability ±500 ppm) RC (LSI2)
 - Internal multispeed 100 kHz to 48 MHz oscillator, factory-trimmed
 - High speed internal 16 MHz factory trimmed RC (±1%)
 - 1x PLL for system clock, ADC
 - Memories
 - 320 KB flash memory with sector protection (PCROP) against R/W operations, enabling radio stack and application
 - 48 KB SRAM, including 36 KB with hardware parity check

- 20x 32-bit backup register
- Boot loader supporting USART, SPI, I2C interfaces
- 1 Kbyte (128 double words) OTP
- OTA (over the air) Bluetooth® Low Energy
- Rich analog peripherals (down to 2.0 V)
 - 12-bit ADC 2.5 Msps, 190 µA/Msps
- System peripherals
 - Inter processor communication controller (IPCC) for communication with Bluetooth® Low Energy
 - HW semaphores for resource sharing between CPUs
 - 1x DMA controller (7x channels) supporting ADC, SPI, I2C, USART, AES, timers
 - 1x USART (ISO 7816, IrDA, SPI Master, Modbus, and Smartcard mode)
 - 1x SPI 32 Mbit/s
 - 1x I2C (SMBus/PMBus®)
 - Touch sensing controller, up to eight sensors
 - 1x 16-bit, four channels advanced timer
 - 1x 32-bit, four channels timer
 - 2x 16-bit ultra-low-power timer
 - 1x independent SysTick
 - 1x independent watchdog
 - 1x window watchdog
- Security and ID
 - Secure firmware installation (SFI) for Bluetooth® Low Energy SW stack
 - 2x hardware encryption AES maximum 256-bit for the application and the Bluetooth® Low Energy
 - HW public key authority (PKA)
 - Cryptographic algorithms: RSA, Diffie-Helman, ECC over GF(p)
 - True random number generator (RNG)
 - Sector protection against R/W operation (PCROP)
 - CRC calculation unit
 - Die information: 96-bit unique ID
 - IEEE 64-bit unique ID, possibility to derive Bluetooth® Low Energy 48-bit EUI
- Up to 30 fast I/Os, 28 of them 5 V-tolerant
- Development support
 - Serial wire debug (SWD), JTAG for the application processor
 - Application cross trigger
- ECOPACK2 compliant package

1 Introduction

This document provides the ordering information and mechanical device characteristics of the STM32WB10CC microcontroller, based on Arm® cores^(a). Throughout the whole document TBD indicates a value to be defined.

This document must be read with the reference manual (RM0478), available from the STMicroelectronics website www.st.com.

For information on the device errata with respect to the datasheet and reference manual, refer to the STM32WB10CC errata sheet (ES0556), available from the STMicroelectronics website www.st.com.

For information on the Arm® Cortex®-M4 and Cortex®-M0+ cores, refer, respectively, to the Cortex®-M4 Technical Reference Manual and to the Cortex®-M0+ Technical Reference Manual, both available on the www.arm.com website.

For information on Bluetooth® refer to www.bluetooth.com.

arm

a. Arm is a registered trademark of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

2 Description

The STM32WB10CC multiprotocol wireless and ultra-low-power device embeds a powerful and ultra-low-power radio compliant with the Bluetooth® Low Energy SIG specification 5.4. It contains a dedicated Arm® Cortex®-M0+ for performing all the real-time low layer operation.

The device is designed to be extremely low-power and is based on the high-performance Arm® Cortex®-M4 32-bit RISC core operating at a frequency of up to 64 MHz. This core features a Floating point unit (FPU) single precision that supports all Arm® single-precision data-processing instructions and data types. It also implements a full set of DSP instructions and a memory protection unit (MPU) that enhances application security.

Enhanced inter-processor communication is provided by the IPCC with six bidirectional channels. The HSEM provides hardware semaphores used to share common resources between the two processors.

The device embeds high-speed memories (320 Kbytes of flash memory, 48 Kbytes of SRAM) and an extensive range of enhanced I/Os and peripherals.

Direct data transfer between memory and peripherals and from memory to memory is supported by seven DMA channels with a full flexible channel mapping by the DMAMUX peripheral.

The device features several mechanisms for embedded flash memory and SRAM: readout protection, write protection and proprietary code readout protection. Portions of the memory can be secured for Cortex®-M0+ exclusive access.

The AES encryption engine, PKA, and RNG enable upper layer cryptography.

The device offers a fast 12-bit ADC.

The device embeds a low-power RTC, one advanced 16-bit timer, one general-purpose 32-bit timer, and two 16-bit low-power timers.

In addition, up to three capacitive sensing channels are available.

The STM32WB10CC also features standard and advanced communication interfaces, namely one USART (ISO 7816, IrDA, Modbus, and Smartcard mode), one I2C (SMBus/PMBus), one SPI up to 32 MHz.

The STM32WB10CC operates in the -10 to +85 °C (+105 °C junction) temperature range from a 2.0 to 3.6 V power supply. A comprehensive set of power-saving modes enables the design of low-power applications.

The device includes independent power supplies for analog input for ADC.

A V_{BAT} dedicated supply allows the device to back up the LSE 32.768 kHz oscillator, the RTC and the backup registers, thus enabling the STM32WB10CC to supply these functions even if the main V_{DD} is not present through a CR2032-like battery, a Supercap or a small rechargeable battery.

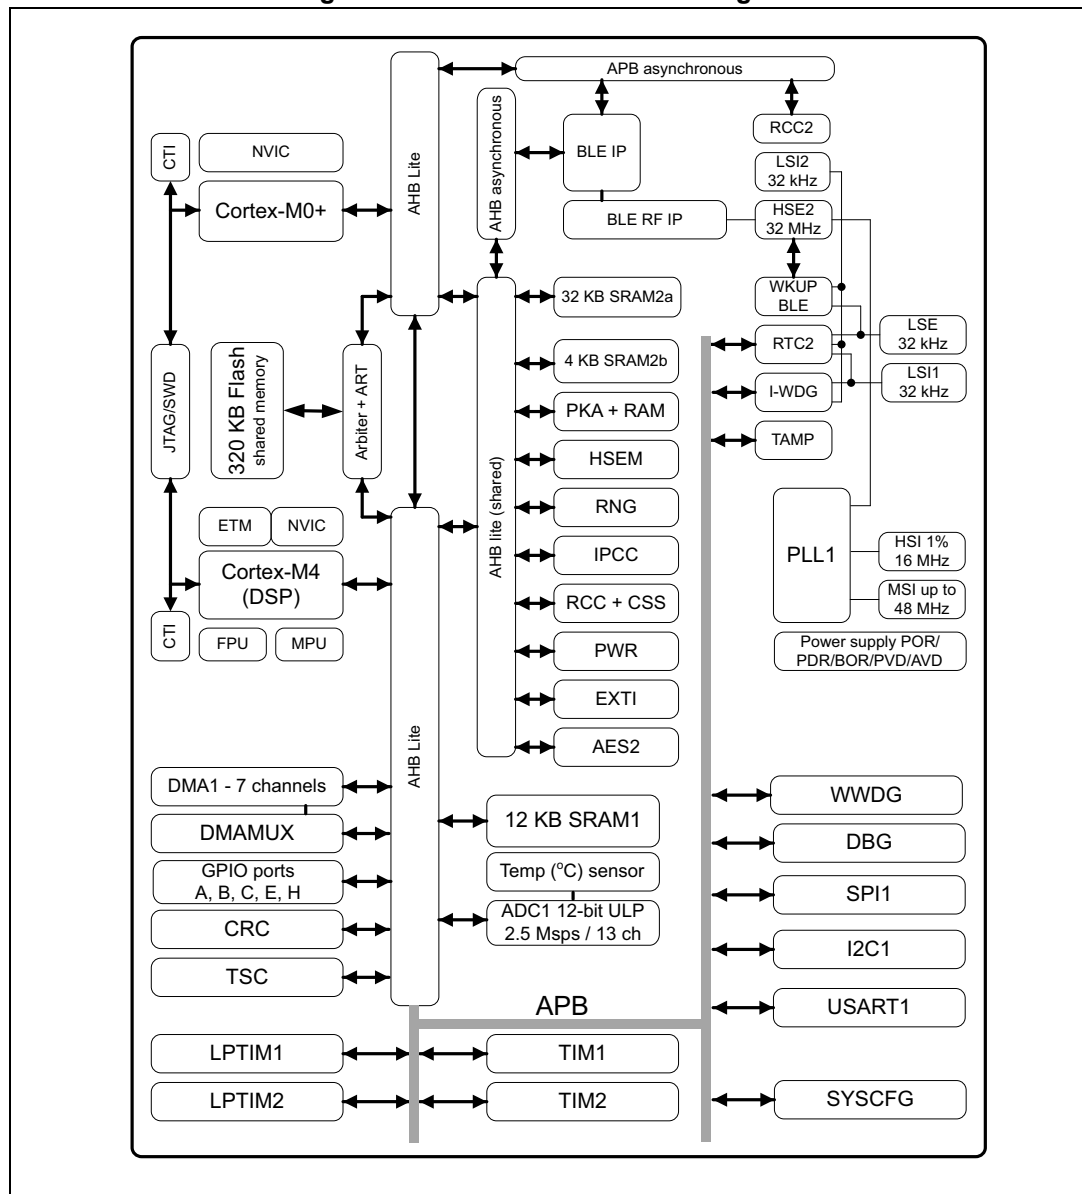

The STM32WB10CC is available in a 48-pin UFQFPN package.

Table 1. STM32WB10CC device features and peripheral counts

Feature		STM32WB10CC
Flash memory density		320 Kbytes
SRAM density		48 Kbytes
BLE		5.4 (1 Mbps)
Timers	Advanced	1 (16-bit)
	General purpose	1 (32-bit)
	Low power	2 (16-bit)
	SysTick	1
Communication interface	SPI	1
	I2C	1
	USART ⁽¹⁾	1
RTC		1
Tamper pin		1
Wakeup pin		2
GPIOs		30
Capacitive sensing		3
12-bit ADC Number of channels		13 channels (including 3 internal)
Internal V _{ref}		Yes
Max CPU frequency		64 MHz
Operating temperature		Ambient operating temperature: -10 to +85 °C Junction temperature: -10 to 105 °C
Operating voltage		2.0 to 3.6 V
Package		UFQFPN48 7 mm x 7 mm, 0.5 mm pitch, solder pad

1. USART peripheral can be used as SPI.

Figure 1. STM32WB10CC block diagram

3 Functional overview

3.1 Architecture

The STM32WB10CC multiprotocol wireless device embeds a Bluetooth Low Energy RF subsystem that interfaces with a generic microcontroller subsystem using an Arm® Cortex®-M4 CPU (called CPU1) on which the host application resides.

The RF subsystem is composed of an RF analog front end, Bluetooth Low Energy block as well as of a dedicated Arm® Cortex®-M0+ microcontroller (called CPU2), plus proprietary peripherals. The RF subsystem performs all of the Bluetooth Low Energy stack, reducing the interaction with the CPU1 to high level exchanges.

Some functions are shared between the RF subsystem CPU (CPU2) and the Host CPU (CPU1):

- Flash memories
- SRAM1, SRAM2a, and SRAM2b (all can be retained in Standby mode)
- Security peripherals (RNG, PKA)
- Clock RCC
- Power control (PWR)

The communication and the sharing of peripherals between the RF subsystem and the Cortex®-M4 CPU is performed through a dedicated inter processor communication controller (IPCC) and semaphore mechanism (HSEM).

3.2 Arm® Cortex®-M4 core with FPU

The Arm® Cortex®-M4 with FPU is a processor for embedded systems. It has been developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced response to interrupts.

The Arm® Cortex®-M4 with FPU 32-bit RISC processor features exceptional code-efficiency, delivering the high-performance expected from an Arm® core in the memory size usually associated with 8- and 16-bit devices.

The processor supports a set of DSP instructions enabling efficient signal processing and complex algorithm execution.

Its single precision FPU speeds up software development by using metalanguage development tools, while avoiding saturation.

With its embedded Arm® core, the STM32WB10CC is compatible with all Arm® tools and software.

Figure 1 shows the general block diagram of the device.

3.3 Memories

3.3.1 Adaptive real-time memory accelerator (ART Accelerator)

The ART Accelerator is a memory accelerator optimized for STM32 industry-standard Arm® Cortex®-M4 processors. It balances the inherent performance advantage of the Arm® Cortex®-M4 over flash memory technologies, which normally require the processor to wait for the flash memory at higher frequencies.

To release the processor near 80 DMIPS performance at 64 MHz, the accelerator implements an instruction prefetch queue and branch cache, which increases program execution speed from the 64-bit flash memory. Based on CoreMark benchmark, the performance achieved thanks to the ART accelerator is equivalent to 0 wait state program execution from flash memory at a CPU frequency up to 64 MHz.

3.3.2 Memory protection unit

The memory protection unit (MPU) is used to manage the CPU1 accesses to memory to prevent one task to accidentally corrupt the memory or resources used by any other active task. This memory area is organized into up to eight protected areas, which can be divided up into eight subareas. The protection area sizes are between 32 bytes and the whole 4 Gbytes of addressable memory.

The MPU is especially helpful for applications where some critical or certified code must be protected against the misbehavior of other tasks. It is usually managed by an RTOS (real-time operating system). If a program accesses a memory location prohibited by the MPU, the RTOS detects it and acts. In an RTOS environment, the kernel can dynamically update the MPU area setting, based on the process to be executed.

The MPU is optional and can be bypassed for applications that do not need it.

3.3.3 Embedded flash memory

The STM32WB10CC device features 320 Kbytes of embedded flash memory available for storing programs and data, as well as some customer keys.

Flexible protections can be configured thanks to option bytes:

- Readout protection (RDP) to protect the whole memory. Three levels are available:
 - Level 0: no readout protection
 - Level 1: memory readout protection: the flash memory cannot be read from or written to if either debug features are connected, boot in SRAM or bootloader is selected
 - Level 2: chip readout protection: debug features (Cortex®-M4 and Cortex®-M0+ JTAG and serial wire), boot in SRAM and bootloader selection are disabled (JTAG fuse). This selection is irreversible.

Table 2. Access status vs. readout protection level and execution modes

Area	Protection level	User execution			Debug, boot from SRAM or boot from system memory (loader)		
		Read	Write	Erase	Read	Write	Erase
Main memory	1	Yes	Yes	Yes	No	No	No
	2	Yes	Yes	Yes	N/A	N/A	N/A
System memory	1	Yes	No	No	Yes	No	No
	2	Yes	No	No	N/A	N/A	N/A
Option bytes	1	Yes	Yes	Yes	Yes	Yes	Yes
	2	Yes	No ⁽¹⁾	No ⁽¹⁾	N/A	N/A	N/A
Backup registers	1	Yes	Yes	N/A ⁽²⁾	No	No	N/A ⁽²⁾
	2	Yes	Yes	N/A	N/A	N/A	N/A
SRAM2a SRAM2b	1	Yes	Yes	Yes ⁽²⁾	No	No	No ⁽²⁾
	2	Yes	Yes	Yes	N/A	N/A	N/A

1. The option byte can be modified by the RF subsystem.

2. Erased when RDP changes from Level 1 to Level 0.

- Write protection (WRP): the protected area is protected against erasing and programming. Two areas can be selected, with 4-Kbyte granularity.
- Proprietary code readout protection (PCROP): two parts of the flash memory can be protected against read and write from third parties. The protected area is execute-only: it can only be reached by the STM32 CPU, as an instruction code, while all other accesses (DMA, debug and CPU data read, write and erase) are strictly prohibited. Two areas can be selected, with 2-Kbyte granularity. An additional option bit (PCROP_RDP) makes possible to select if the PCROP area is erased or not when the RDP protection is changed from Level 1 to Level 0.

A section of the flash memory is secured for the RF subsystem CPU2, and cannot be accessed by the host CPU1.

The whole nonvolatile memory embeds the error correction code (ECC) feature supporting:

- single error detection and correction
- double error detection
- the address of the ECC fail can be read in the ECC register

The embedded flash memory is shared between CPU1 and CPU2 on a time sharing basis. A dedicated HW mechanism allows both CPUs to perform Write/Erase operations.

3.3.4 Embedded SRAM

The STM32WB10CC device features 48 Kbytes of embedded SRAM, split in three blocks:

- **SRAM1**: 12 Kbytes mapped at address 0x2000 0000
- **SRAM2a**: 32 Kbytes located at address 0x2003 0000 also mirrored at 0x1000 0000, with hardware parity check
- **SRAM2b**: 4 Kbytes located at address 0x2003 8000 (contiguous with SRAM2a) and mirrored at 0x1000 8000 with hardware parity check

SRAM2a and SRAM2b can be write-protected, with 1-Kbyte granularity. A section of the SRAM2a and SRAM2b is secured for the RF sub-system and cannot be accessed by the host CPU1.

The SRAMs can be accessed in read/write with 0 wait states for all CPU1 and CPU2 clock speeds.

3.4 Security and safety

The STM32WB10CC contains many security blocks both for the Bluetooth Low Energy and the Host application.

It includes:

- Secure flash memory partition for RF subsystem-only access
- Secure SRAM partition, that can be accessed only by the RF subsystem
- True random number generator (RNG)
- Advance encryption standard hardware accelerator (AES-256bit, supporting chaining modes ECB, CBC, CTR, GCM, GMAC, CCM)
- Private key acceleration (PKA) including:
 - Modular arithmetic including exponentiation with maximum modulo size of 3136 bits
 - Elliptic curves over prime field scalar multiplication, ECDSA signature, ECDSA verification with maximum modulo size of 521 bits
- Cyclic redundancy check calculation unit (CRC)

A specific mechanism is in place to ensure that all the code executed by the RF subsystem CPU2 can be secure, whatever the Host application.

3.5 Boot modes and FW update

At startup, BOOT0 pin and BOOT1 option bit are used to select one of three boot options:

- Boot from user flash
- Boot from system memory
- Boot from embedded SRAM

The device always boots on CPU1 core. The embedded bootloader code makes it possible to boot from various peripherals:

- UART
- I2C
- SPI

Secure Firmware update from system boot is provided.

3.6 RF subsystem

The STM32WB10CC embeds an ultra-low power multi-standard radio Bluetooth Low Energy, compliant with Bluetooth specification 5.4. The Bluetooth Low Energy features 1 Mbps transfer rate, supports multiple roles simultaneously acting at the same time as

Bluetooth Low Energy sensor and hub device, embeds Elliptic Curve Diffie-Hellman (ECDH) key agreement protocol, thus ensuring a secure connection.

The Bluetooth Low Energy stack runs on an embedded Arm® Cortex®-M0+ core (CPU2). The stack is stored on the embedded flash memory, which is also shared with the Arm® Cortex®-M4 (CPU1) application, making it possible in-field stack update.

3.6.1 RF front-end block diagram

The RF front-end is based on a direct modulation of the carrier in Tx, and uses a low IF architecture in Rx mode.

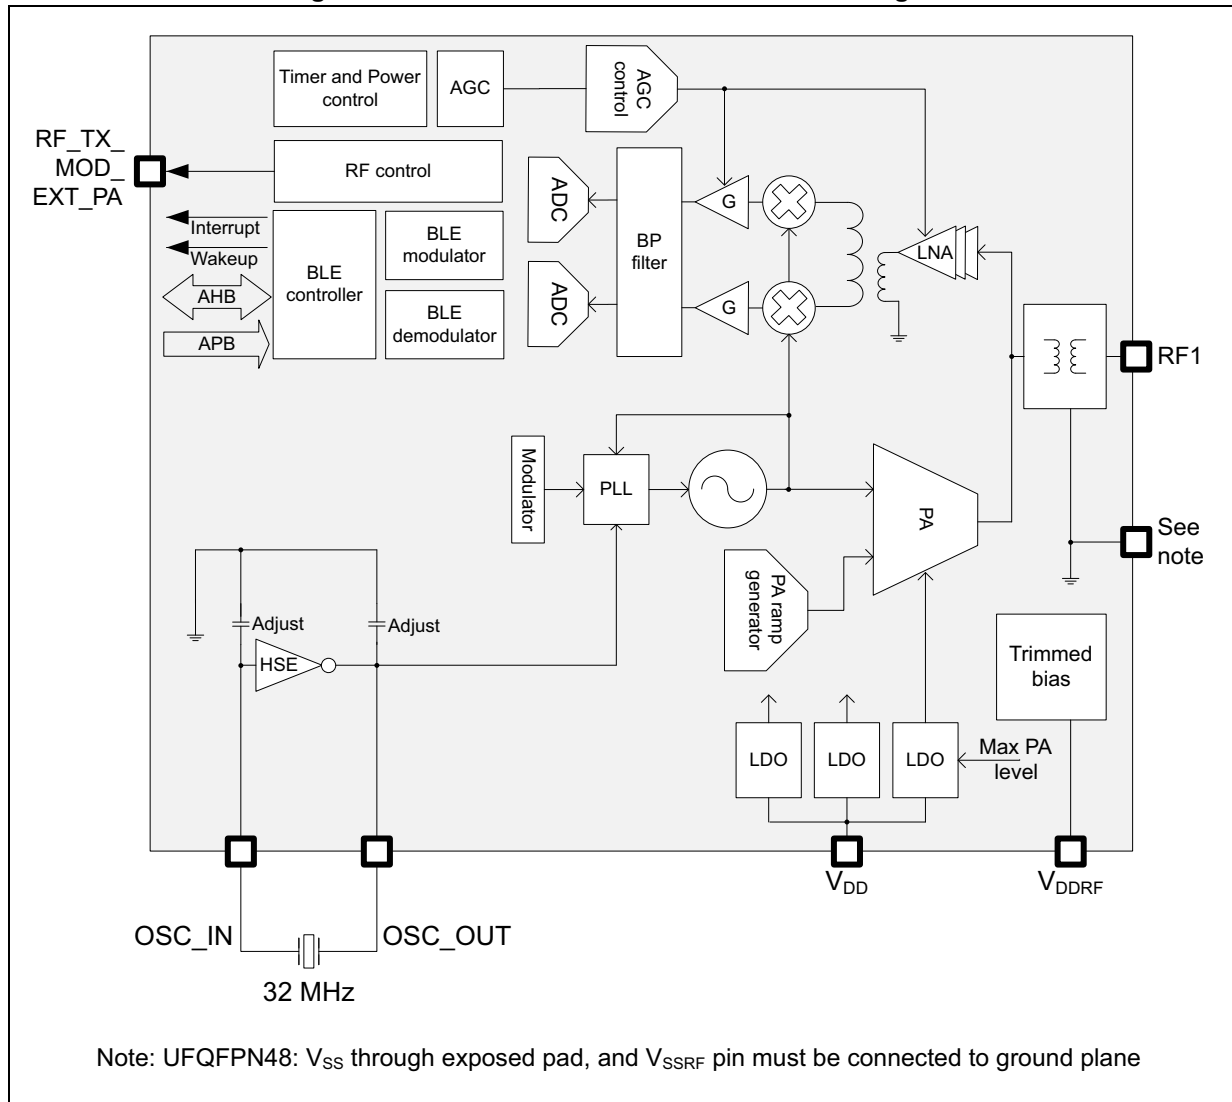

Thanks to an internal transformer at RF pins, the circuit directly interfaces the antenna (single ended connection, impedance close to 50 Ω). The natural bandpass behavior of the internal transformer, simplifies outside circuitry aimed for harmonic filtering and out of band interferer rejection.

In Transmit mode, the maximum output power is user selectable through the programmable LDO voltage of the power amplifier. A linearized, smoothed analog control offers clean power ramp-up.

In receive mode the circuit can be used in standard high performance or in reduced power consumption (user programmable). The Automatic gain control (AGC) is able to reduce the chain gain at both RF and IF locations, for optimized interference rejection. Thanks to the use of complex filtering and highly accurate I/Q architecture, high sensitivity and excellent linearity can be achieved.

The bill of material is reduced thanks to the high degree of integration. The radio frequency source is synthesized from an external 32 MHz crystal that does not need any external trimming capacitor network thanks to a dual network of user programmable integrated capacitors.

Figure 2. STM32WB10CC RF front-end block diagram

3.6.2 Bluetooth Low Energy general description

The Bluetooth Low Energy block is a master/slave processor, compliant with Bluetooth specification 5.4 standard (1 Mbps).

It integrates a 2.4 GHz RF transceiver and a powerful Cortex[®]-M0+ core, on which a complete power-optimized stack for Bluetooth Low Energy protocol runs, providing master / slave role support

- GAP: central, peripheral, observer or broadcaster roles
- ATT/GATT: client and server
- SM: privacy, authentication and authorization
- L2CAP
- Link layer: AES-128 encryption and decryption

In addition, according to Bluetooth specification 5.4, the Bluetooth Low Energy block provides:

- Multiple roles simultaneous support
- Master/slave and multiple roles simultaneously
- LE data packet length extension (making it possible to reach 800 kbps at application level)
- LE privacy 1.2
- LE secure connections
- Flexible Internet connectivity options

The device supports Piconet topology (master with up to eight slaves), Scatternet topology (master with up to six slaves and dynamically as slave with up to two masters, or master with up to four slaves and dynamically as slave with up to four masters), and multi slave topology (slave with up to eight masters).

The device allows the applications to meet the tight peak current requirements imposed by the use of standard coin cell batteries.

Ultra-low-power sleep modes and very short transition time between operating modes result in very low average current consumption during real operating conditions, resulting in longer battery life.

The Bluetooth Low Energy block integrates a full bandpass balun, thus reducing the need for external components.

The link between the Cortex[®]-M4 application processor (CPU1) running the application, and the Bluetooth Low Energy stack running on the dedicated Cortex[®]-M0+ (CPU2) is performed through a normalized API, using a dedicated IPCC.

3.6.3 RF pin description

The RF block contains dedicated pins, listed in [Table 3](#).

Table 3. RF pin list

Name	Type	Description
RF1	I/O	RF Input/output, must be connected to the antenna through a low-pass matching network
OSC_OUT		32 MHz main oscillator, also used as HSE source
OSC_IN		
RF_TX_MOD_EXT_PA		External PA transmit control
VDDRF	V _{DD}	Dedicated supply, must be connected to V _{DD}
VSSRF ⁽¹⁾	V _{SS}	To be connected to GND

1. The exposed pad must be connected to GND plane for correct RF operation.

3.6.4 Typical RF application schematic

The schematic in [Figure 3](#) and the external components listed in [Table 3](#) are purely indicative. For more details refer to the “Reference design” provided in separate documents.

Figure 3. External components for the RF part

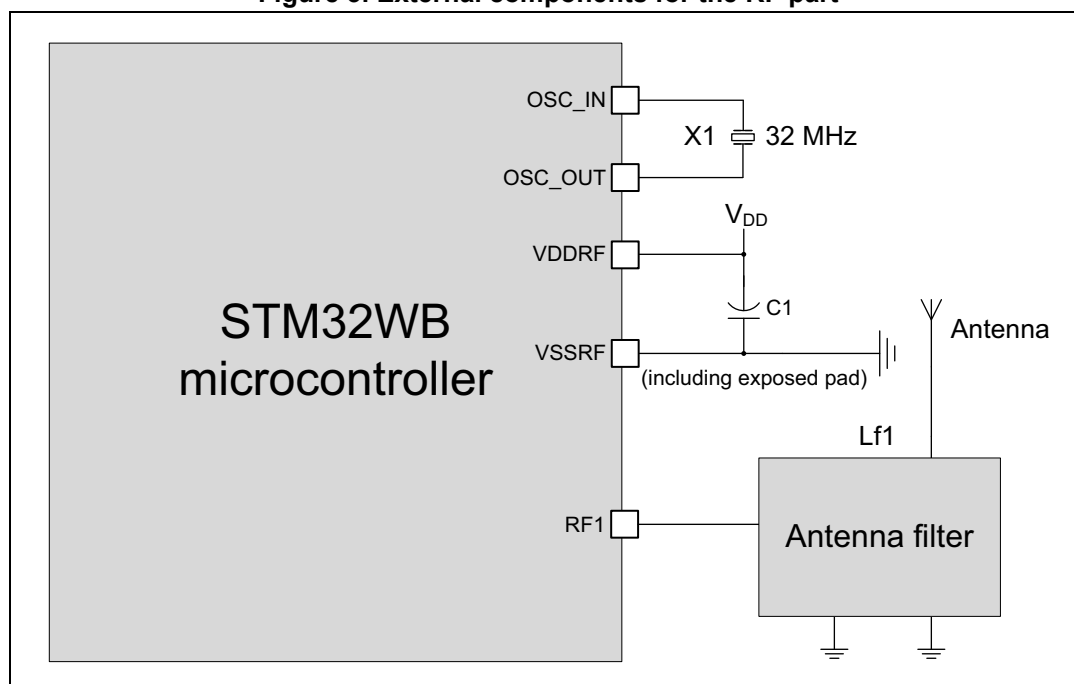

Table 4. Typical external components

Component	Description	Value
C1	Decoupling capacitance for RF	100 nF // 100 pF
X1	32 MHz crystal ⁽¹⁾	32 MHz
Antenna filter	Antenna filter and matching network	Refer to AN5165, on www.st.com
Antenna	2.4 GHz band antenna	-

1. e.g. NDK reference: NX2016SA 32 MHz EXS00A-CS06654.

Note: For more details refer to AN5165 “Development of RF hardware using STM32WB microcontrollers” available on www.st.com.

3.7 Power supply management

3.7.1 Power supply schemes

The device has different voltage supplies (see [Figure 5](#)) and can operate within the following voltage ranges:

- $V_{DD} = 2.0$ to 3.6 V: external power supply for I/Os (V_{DDIO}), the internal regulator and system functions such as RF, reset, power management and internal clocks. It is provided externally through VDD pins. V_{DDRF} must be always connected to VDD pins.
- $V_{DDA} = 2.0$ to 3.6 V: external analog power supply for ADC. The V_{DDA} voltage level can be independent from the V_{DD} voltage. When not used V_{DDA} must be connected to V_{DD} .

During power up/down, the following power sequence requirements must be respected:

- When V_{DD} is below 1 V the other power supply (V_{DDA}), must remain below $V_{DD} + 300$ mV
- When V_{DD} is above 1 V all power supplies are independent.

Figure 4. Power-up/down sequence

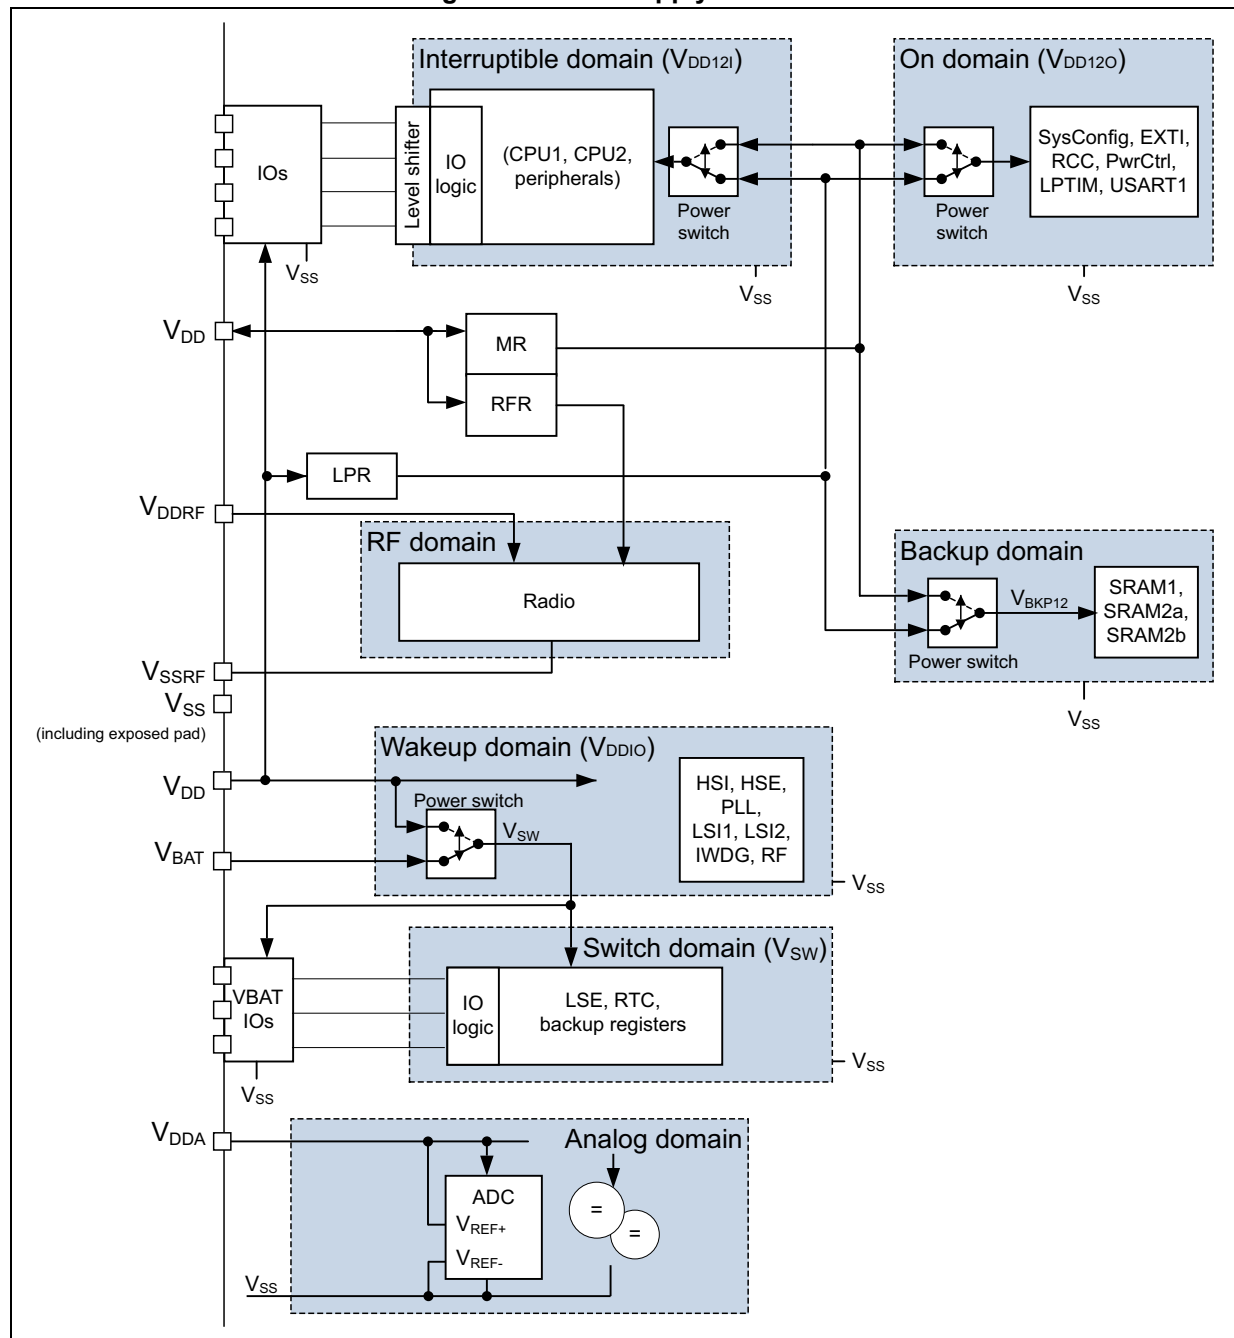

1. V_{DDX} refers to V_{DDA} .

During the power down phase, V_{DD} can temporarily become lower than other supplies only if the energy provided to the MCU remains below 1 mJ. This allows the external decoupling capacitors to be discharged with different time constants during the power down transient phase.

Note: V_{DD} and V_{DDRF} must be wired together, so they can follow the same voltage sequence.

Figure 5. Power supply overview

3.7.2 Linear voltage regulator

Three embedded linear voltage regulators supply most of the digital and RF circuitries, the main regulator (MR), the low-power regulator (LPR) and the RF regulator (RFR).

- The MR is used in the Run and Sleep modes and in the Stop 0 mode.
- The LPR is used in Low-Power Run, Low-Power Sleep and Stop 1 modes. It is also used to supply the SRAMs in Standby with retention.
- The RFR is used to supply the RF analog part, its activity is automatically managed by the RF subsystem.

All the regulators are in power-down in Standby and Shutdown modes: the regulator output is in high impedance, and the kernel circuitry is powered down, inducing zero consumption.

The ultralow-power STM32WB10CC supports dynamic voltage scaling to optimize its power consumption in run mode. The voltage from the main regulator that supplies the logic (VCORE) can be adjusted according to the system's maximum operating frequency.

VCORE can also be supplied by the low-power regulator, the main regulator being switched off. The system is then in Low-power run mode. In this case the CPU is running at up to 2 MHz, and peripherals with independent clock can be clocked by HSI16 (in this mode the RF subsystem is not available).

3.7.3 Power supply supervisor

An integrated ultra-low-power brown-out reset (BOR) is active in all modes except Shutdown ensuring proper operation after power-on and during power down. The device remains in reset mode when the monitored supply voltage V_{DD} is below a specified threshold, without the need for an external reset circuit.

The lowest BOR level is 2.0 V at power on, and other higher thresholds can be selected through option bytes. The device features an embedded programmable voltage detector (PVD) that monitors the V_{DD} power supply and compares it with the V_{PVD} threshold. An interrupt can be generated when V_{DD} drops below the V_{PVD} threshold and/or when V_{DD} is higher than the V_{PVD} threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

3.7.4 Low-power modes

This ultra-low-power device supports several low-power modes to achieve the best compromise between low-power consumption, short startup time, available peripherals and available wake-up sources.

By default, the microcontroller is in Run mode, after a system or a power on reset. It is up to the user to select one of the low-power modes described below:

- **Sleep**
In Sleep mode, only the CPU1 is stopped. All peripherals, including the RF subsystem, continue to operate and can wake up the CPU when an interrupt/event occurs.
- **Low-power run**
This mode is achieved with VCORE supplied by the low-power regulator to minimize the regulator operating current. The code can be executed from SRAM or from the flash memory, and the CPU1 frequency is limited to 2 MHz. The peripherals with independent clock can be clocked by HSI16. The RF subsystem is not available in this

mode and must be OFF.

- **Low-power sleep**

This mode is entered from the low-power run mode. Only the CPU1 clock is stopped. When wake-up is triggered by an event or an interrupt, the system reverts to the low-power run mode. The RF subsystem is not available in this mode and must be OFF.

- **Stop 0 and Stop 1**

Stop modes achieve the lowest power consumption while retaining the content of all the SRAM and registers. The LSE (or LSI) is still running.

The RTC can remain active (Stop mode with RTC, Stop mode without RTC).

Some peripherals with wake-up capability can enable the HSI16 RC during Stop modes to detect their wake-up condition.

Two modes are available: Stop 0 and Stop 1.

Stop 1 offers several active peripherals and wake-up sources. In Stop 0 mode the main regulator remains ON, allowing a very fast wake-up time but with higher consumption.

In these modes the RF subsystem can wait for incoming events in all Stop modes.

The system clock when exiting from Stop 0 Stop1 modes can be either MSI up to 48 MHz or HSI16 if the RF subsystem is disabled. If the RF subsystem is used the exits must be set to HSI16 only.

- **Standby**

The Standby mode is used to achieve the lowest power consumption with BOR. The internal regulator is switched off so that the VCORE domain is powered off.

The RTC can remain active (Standby mode with RTC).

The brown-out reset (BOR) always remains active in Standby mode.

The state of each I/O during standby mode can be selected by software: I/O with internal pull-up, internal pull-down or floating.

After entering Standby mode, register content is lost except for registers in the Backup domain and Standby circuitry. Optionally, SRAMs can be retained in Standby mode, supplied by the low-power regulator (Standby with 48 KB SRAM retention mode).

The device exits Standby mode when an external reset (NRST pin), an IWDG reset, WKUP pin event (configurable rising or falling edge), or an RTC event occurs (alarm, periodic wake-up, timestamp, tamper) or a failure is detected on LSE (CSS on LSE).

The system clock after wake-up is 16 MHz, derived from the HSI16. This low power mode is not selectable for Radio activity.

- Shutdown**

This mode achieves the lowest power consumption. The internal regulator is switched off so that the VCORE domain is powered off.

The RTC can remain active (Shutdown mode with RTC, Shutdown mode without RTC).

The BOR is not available in Shutdown mode. No power voltage monitoring is possible in this mode, therefore the switch to Backup domain is not supported.

SRAM1, SRAM2a, SRAM2b and register contents are lost except for registers in the Backup domain.

The device exits Shutdown mode when an external reset (NRST pin), a WKUP pin event (configurable rising or falling edge), or an RTC event occurs (alarm, periodic wake-up, timestamp, tamper).

The system clock after wake-up is 4 MHz, derived from the MSI.

This low-power mode is not selectable for Radio activity.

When the RF subsystem is active, it changes the power state according to its needs (Run, Stop, Standby). This operation is transparent for the CPU1 host application and managed by a dedicated HW state machine. At any given time the effective power state reached is the higher one needed by both the CPU1 and RF sub-system.

[Table 5](#) summarizes the peripheral features over all available modes. Wake-up capability is detailed in gray cells.

Table 5. Functionalities depending on system operating mode⁽¹⁾

Peripheral	Run	Sleep	Low-power run	Low-power sleep	Stop0		Stop1		Standby		Shutdown		VBAT

1. Legend: Y = Yes (enabled). O = Optional (disabled by default, can be enabled by software).
R = data retained. - = Not available. Gray cells indicate wake-up capability.

2. Standby with SRAM retention mode only.

3. The SRAM clock can be gated on or off.
4. Some peripherals with wake-up from Stop capability can request HSI16 to be enabled. In this case, HSI16 is woken up by the peripheral, and only feeds the peripheral which requested it. HSI16 is automatically put off when the peripheral does not need it anymore.
5. UART reception is functional in Stop mode, and generates a wake-up interrupt on Start, address match or received frame event.
6. I2C address detection is functional in Stop mode, and generates a wake-up interrupt in case of address match.
7. I/Os can be configured with internal pull-up, pull-down or floating in Standby mode.
8. The I/Os with wake-up from Standby/Shutdown capability are PA0 and PA2.
9. I/Os can be configured with internal pull-up, pull-down or floating in Shutdown mode but the configuration is lost when exiting the Shutdown mode.

Table 6. STM32WB10CC modes overview

Mode	Regulator	CPU1	Flash	SRAM	Clocks	DMA and Peripherals	Wake-up source	Consumption ⁽¹⁾	Wake-up time

1. Typical current at $V_{DD} = 2.4$ V, 25 °C. for STOPx, SHUTDOWN and Standby, else $V_{DD} = 3.3$ V, 25 °C.

2. The flash memory controller can be placed in power-down mode if the RF subsystem is not in use and all the program is run from the SRAM.

3. The SRAM1 and SRAM2 clocks can be gated off independently.

4. HSE (32 MHz) automatically used when RF activity is needed by the RF subsystem.

- 5. HSI16 (16 MHz) automatically used by some peripherals.
- 6. U(S)ART reception is functional in Stop mode, and generates a wake-up interrupt on Start, Address match or Received frame event.
- 7. I2C address detection is functional in Stop mode, and generates a wake-up interrupt in case of address match.
- 8. I/Os with wake-up from Standby/Shutdown capability: PA0, PA2.
- 9. I/Os can be configured with internal pull-up, pull-down or floating but the configuration is lost immediately when exiting the Shutdown mode.

3.7.5 Reset mode

To improve the consumption under reset, the I/Os state under and after reset is “analog state” (the I/O Schmitt trigger is disabled). In addition, the internal reset pull-up is deactivated when the reset source is internal.

3.8 VBAT operation

The VBAT pin allows to power the device VBAT domain (RTC, LSE and Backup registers) from an external battery, an external supercapacitor, or from V_{DD} when no external battery nor an external supercapacitor are present. One anti-tamper detection pin is available in VBAT mode.

VBAT operation is automatically activated when V_{DD} is not present.

An internal VBAT battery charging circuit is embedded and can be activated when V_{DD} is present.

Note: *When the microcontroller is supplied only from VBAT, external interrupts and RTC alarm/events do not exit it from VBAT operation.*

3.9 Interconnect matrix

Several peripherals have direct connections between them. This allows autonomous communication between peripherals, saving CPU1 resources and, consequently, reducing power supply consumption. In addition, these hardware connections result in fast and predictable latency.

Depending on peripherals, these interconnections can operate in Run, Sleep, Low-power run and Sleep, Stop 0 and Stop 1 modes.

Table 7. STM32WB10CC CPU1 peripherals interconnect matrix

Source	Destination	Action	Run	Sleep	Low-power run	Low-power	Stop 0 / Stop 1
TIMx	TIMx	Timers synchronization or chaining	Y	Y	Y	Y	-
	ADC1	Conversion triggers	Y	Y	Y	Y	-
	DMA	Memory to memory transfer trigger	Y	Y	Y	Y	-

3.10 Clocks and startup

The STM32WB10CC device integrates several clock sources:

- LSE: 32.768 kHz external oscillator, for accurate RTC and calibration with other embedded RC oscillators
- LSI1: 32 kHz on-chip low-consumption RC oscillator
- LSI2: 32 kHz (untrimmable), on-chip temperature stable RC oscillator, can be used by the RF subsystem instead of LSE
- HSE: high quality 32 MHz external oscillator with trimming, needed by the RF subsystem
- HSI16: 16 MHz high accuracy on-chip RC oscillator
- MSI: 100 kHz to 48 MHz multiple speed on-chip low power oscillator, can be trimmed using the LSE signal

The clock controller (see [Figure 6](#)) distributes the clocks coming from the different oscillators to the core and the peripherals including the RF subsystem. It also manages clock gating for low power modes and ensures clock robustness. It features:

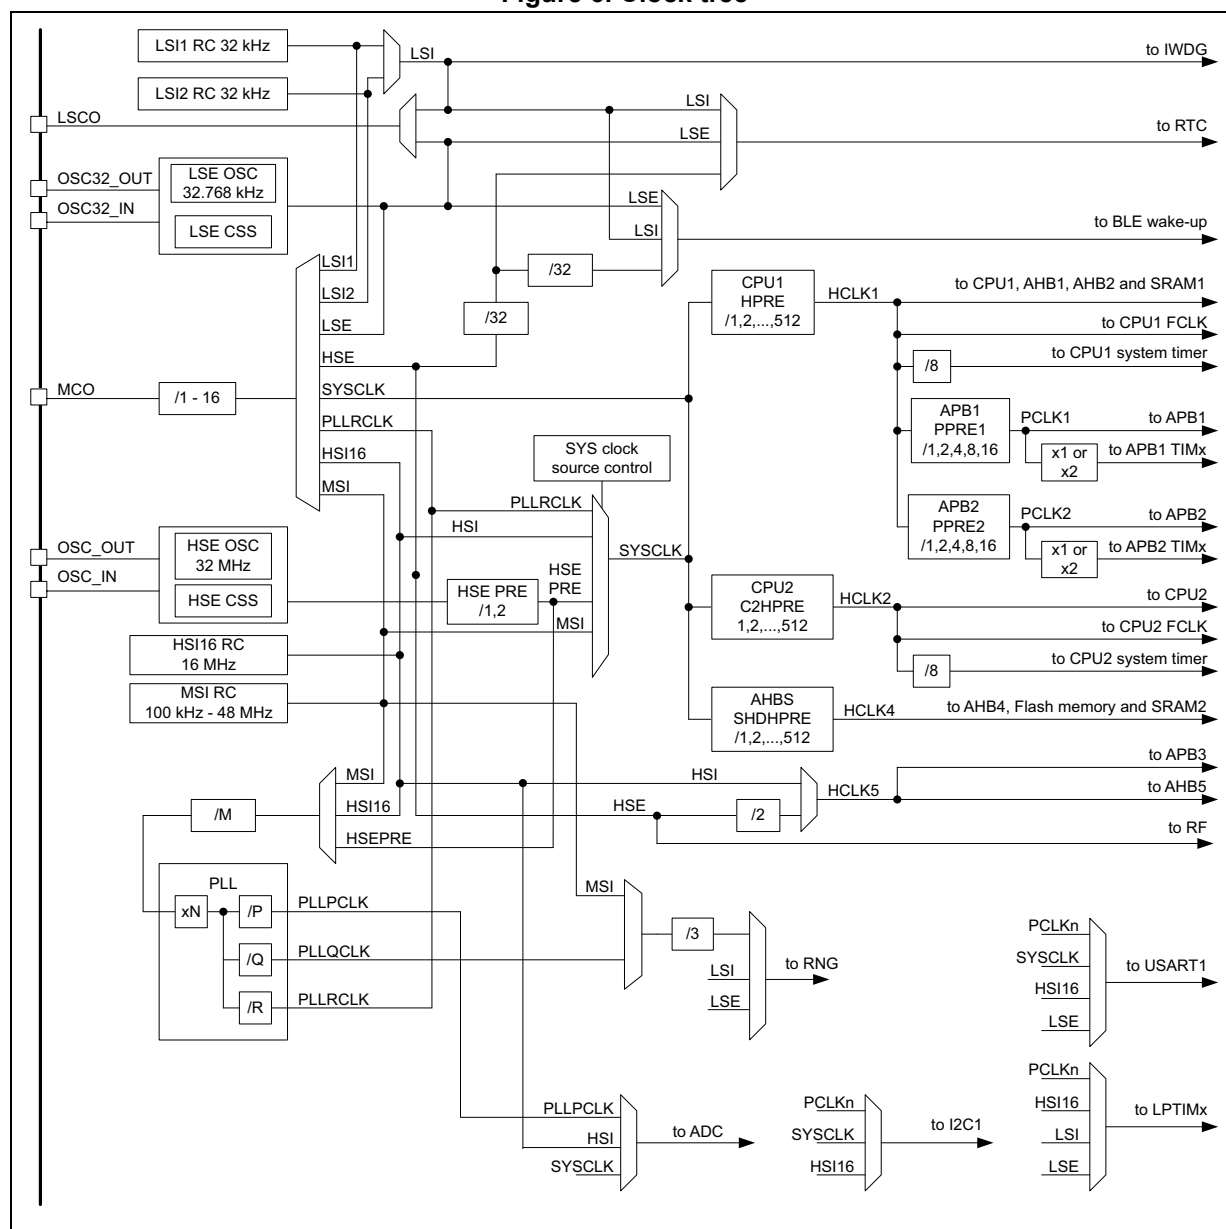

- **Clock prescaler:** to get the best trade-off between speed and current consumption, the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler
- **Safe clock switching:** clock sources can be changed safely on the fly in run mode through a configuration register.
- **Clock management:** to reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- **System clock source:** four different clock sources can be used to drive the master clock SYSCLK:
 - 16 MHz high-speed internal RC oscillator (HSI16), trimmable by software, that can supply a PLL
 - Multispeed internal RC oscillator (MSI), trimmable by software, able to generate 12 frequencies from 100 kHz to 48 MHz. When a 32.768 kHz clock source is available in the system (LSE), the MSI frequency can be automatically trimmed by hardware to reach better than $\pm 0.25\%$ accuracy. The MSI can supply a PLL.
 - System PLL that can be fed by HSE, HSI16 or MSI, with a maximum frequency of 64 MHz.
- **Auxiliary clock source:** two ultralow-power clock sources that can be used to drive the real-time clock:
 - 32.768 kHz low-speed external crystal (LSE), supporting four drive capability modes. The LSE can also be configured in bypass mode for an external clock.
 - 32 kHz low-speed internal RC (LSI1), also used to drive the independent watchdog. The LSI1 clock accuracy is $\pm 5\%$.
 - 32 kHz low-speed internal RC (LSI2), with ± 200 ppm / °C stability over temperature.
- **Peripheral clock sources:** Several peripherals (RNG, USARTs, I2C, LPTimers, ADC) have their own independent clock whatever the system clock. A PLL having three independent outputs for the highest flexibility can generate independent clocks for the ADC and the RNG.
- **Startup clock:** after reset, the microcontroller restarts by default with an internal 4 MHz clock (MSI). The prescaler ratio and clock source can be changed by the application

program as soon as the code execution starts.

- **Clock security system (CSS):** this feature can be enabled by software. If an HSE clock failure occurs, the master clock is automatically switched to HSI16 and a software interrupt is generated if enabled. LSE failure can also be detected and an interrupt generated.
- Clock-out capability:
 - **MCO (microcontroller clock output):** it outputs one of the internal clocks for external use by the application. Low frequency clocks (LSIx, LSE) are available down to Stop 1 low power state.
 - **LSCO (low-speed clock output):** it outputs LSI or LSE in all low-power modes down to Standby.

Several prescalers allow the user to configure the AHB frequencies, the high-speed APB (APB2) and the low-speed APB (APB1) domains. The maximum frequency of the AHB and the APB domains is 64 MHz.

Figure 6. Clock tree

3.11 General-purpose inputs/outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. Fast I/O toggling can be achieved thanks to their mapping on the AHB2 bus.

The I/Os alternate function configuration can be locked, if needed, following a specific sequence in order to avoid spurious writing to the I/Os registers.

3.12 Direct memory access controller (DMA)

The device embeds one DMA. Refer to [Table 8](#) for the features implementation.

Direct memory access (DMA) is used to provide high-speed data transfer between peripherals and memory as well as between memories. Data can be quickly moved by DMA without any CPU action. This keeps CPU resources free for other operations.

The DMA controller has seven channels in total, a full cross matrix allows any peripheral to be mapped on any of the available DMA channels. The DMA has an arbiter for handling the priority between DMA requests.

The DMA supports:

- seven independently configurable channels (requests)
- A full cross matrix between peripherals and all the DMA channels exist. There is also a HW trigger possibility through the DMAMUX.
- Priorities between requests from DMA channels are software programmable (four levels consisting in very high, high, medium and low) or hardware in case of equality (request 1 has priority over request 2, etc.).
- Independent source and destination transfer size (byte, half word, word), emulating packing and unpacking. Source/destination addresses must be aligned on the data size.
- Support for circular buffer management.
- Three event flags (DMA half transfer, DMA transfer complete and DMA transfer error) logically OR-ed together in a single interrupt request for each channel.
- Memory-to-memory transfer.
- Peripheral-to-memory and memory-to-peripheral, and peripheral-to-peripheral transfers.
- Access to flash memory, SRAM, APB and AHB peripherals as source and destination.
- Programmable number of data to be transferred: up to 65536.

Table 8. DMA implementation

DMA features	DMA1
Number of regular channels	7

A DMAMUX block makes it possible to route any peripheral source to any DMA channel.

3.13 Interrupts and events

3.13.1 Nested vectored interrupt controller (NVIC)

The device embeds a nested vectored interrupt controller able to manage 16 priority levels, and handle up to 63 maskable interrupt channels plus the 16 interrupt lines of the Cortex®-M4 with FPU.

The NVIC benefits are the following:

- Closely coupled NVIC gives low latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Allows early processing of interrupts
- Processing of late arriving higher priority interrupts
- Support for tail chaining
- Processor state automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

The NVIC hardware block provides flexible interrupt management features with minimal interrupt latency.

3.13.2 Extended interrupts and events controller (EXTI)

The EXTI manages wake-up through configurable and direct event inputs. It provides wake-up requests to the Power control, and generates interrupt requests to the CPUx NVIC and events to the CPUx event input.

Configurable events/interrupts come from peripherals able to generate a pulse, and make it possible to select the Event/Interrupt trigger edge and/or a SW trigger.

Direct events/interrupts are coming from peripherals having their own clearing mechanism.

3.14 Analog to digital converter (ADC)

The 12-bit analog-to-digital converter has up to ten external and three internal (temperature sensor, voltage reference, VBAT voltage measurement) channels and performs conversions in single-shot or scan modes. In scan mode, automatic conversion is performed on a selected group of analog inputs.

An analog watchdog feature makes possible a very precise monitoring of the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

3.14.1 Temperature sensor

The temperature sensor (TS) generates a voltage V_{TS} that varies linearly with temperature.

The temperature sensor is internally connected to the ADC1_IN12 input channel, which is used to convert the sensor output voltage into a digital value.

To improve the accuracy of the temperature sensor measurement, each device is individually factory-calibrated by ST. The temperature sensor factory calibration data are stored in the system memory area, accessible in read-only mode.

Table 9. Temperature sensor calibration values

Calibration value name	Description	Memory address
TS_CAL1	TS ADC raw data acquired at a temperature of 30 °C (± 5 °C), $V_{DDA} = 3.0$ V (± 10 mV)	0x1FFF 75A8 - 0x1FFF 75A9
TS_CAL2	TS ADC raw data acquired at a temperature of 130 °C (± 5 °C), $V_{DDA} = 3.0$ V (± 10 mV)	0x1FFF 75CA - 0x1FFF 75CB

3.14.2 Internal voltage reference (V_{REFINT})

The internal voltage reference (V_{REFINT}) provides a stable (bandgap) voltage output for the ADC. V_{REFINT} is internally connected to the ADC1_IN13 input channel. The precise voltage of V_{REFINT} is individually measured for each part by ST during production test and stored in the system memory area. It is accessible in read-only mode.

Table 10. Internal voltage reference calibration values

Calibration value name	Description	Memory address
V_{REFINT}	Raw data acquired at a temperature of 30 °C (± 5 °C), $V_{DDA} = 3.6$ V (± 10 mV)	0x1FFF 75AA - 0x1FFF 75AB

3.15 Touch sensing controller (TSC)

The touch sensing controller provides a simple solution for adding capacitive sensing functionality to any application. Capacitive sensing technology is able to detect finger presence near an electrode which is protected from direct touch by a dielectric such as glass or plastic. The capacitive variation introduced by the finger (or any conductive object) is measured using a proven implementation based on a surface charge transfer acquisition principle.

The touch sensing controller is fully supported by the STMTouch touch sensing firmware library (free to use) and enables reliable touch sensing functionality in the end application.

The main features of the touch sensing controller are the following:

- Proven and robust surface charge transfer acquisition principle
- Supports up to three capacitive sensing channels
- Up to three capacitive sensing channels can be acquired in parallel offering a very good response time
- Spread spectrum feature to improve system robustness in noisy environments
- Full hardware management of the charge transfer acquisition sequence
- Programmable charge transfer frequency
- Programmable sampling capacitor I/O pin
- Programmable channel I/O pin
- Programmable max count value to avoid long acquisition when a channel is faulty
- Dedicated end of acquisition and max count error flags with interrupt capability
- One sampling capacitor for up to three capacitive sensing channels to reduce the system components
- Compatible with proximity, touchkey, linear and rotary touch sensor implementation
- Designed to operate with STMTouch touch sensing firmware library

3.16 True random number generator (RNG)

The device embeds a true RNG that delivers 32-bit random numbers generated by an integrated analog circuit.

3.17 Timers and watchdogs

The STM32WB10CC includes one advanced 16-bit timer, one general-purpose 32-bit timer, two low-power timers, two watchdog timers and a SysTick timer. [Table 11](#) compares the features of the advanced control, general purpose and low power timers.

Table 11. Timer features

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/compare channels	Complementary outputs
Advanced control	TIM1	16-bits	Up, down, Up/down	Any integer between 1 and 65536	Yes	4	3
General purpose	TIM2	32-bits	Up, down, Up/down			4	No
Low power	LPTIM1 LPTIM2	16-bits	Up			1	1

3.17.1 Advanced-control timer (TIM1)

The advanced-control timer can be seen as a three-phase PWM multiplexed on six channels. They have complementary PWM outputs with programmable inserted

dead-times. They can also be seen as complete general-purpose timers. The four independent channels can be used for:

- Input capture
- Output compare
- PWM generation (edge or center-aligned modes) with full modulation capability (0 to 100%)
- One-pulse mode output

In debug mode, the advanced-control timer counter can be frozen and the PWM outputs disabled to turn off any power switches driven by these outputs.

Many features are shared with those of the general-purpose TIMx timers (described in [Section 3.17.2](#)) using the same architecture, so the advanced-control timers can work together with the TIMx timers via the Timer Link feature for synchronization or event chaining.

3.17.2 General-purpose timer (TIM2)

There is one synchronizable general-purpose timer embedded in the STM32WB10CC (see [Table 11](#)), it can be used to generate PWM outputs, or act as a simple time base.

- TIM2
 - Full-featured general-purpose timer
 - Features four independent channels for input capture/output compare, PWM or one-pulse mode output. Can work together, or with the other general-purpose timers via the Timer Link feature for synchronization or event chaining.
 - The counter can be frozen in debug mode.
 - Independent DMA request generation, support of quadrature encoders.

3.17.3 Low-power timer (LPTIM1 and LPTIM2)

The device embeds two low-power timers, having an independent clock running in Stop mode if they are clocked by LSE, LSIx or by an external clock. They are able to wake-up the system from Stop mode.

LPTIM1 is active in Stop 0 and Stop 1 modes.

LPTIM2 is active in Stop 0 and Stop 1 modes.

The low-power timers support the following features:

- 16-bit up counter with 16-bit autoreload register
- 16-bit compare register
- Configurable output: pulse, PWM
- Continuous/ one shot mode
- Selectable software/hardware input trigger
- Selectable clock source
 - Internal clock sources: LSE, either LSI1 or LSI2, HSI16 or APB clock
 - External clock source over LPTIM input (working even with no internal clock source running, used by pulse counter application)
- Programmable digital glitch filter
- Encoder mode (LPTIM1 only)

3.17.4 Independent watchdog (IWDG)

The independent watchdog is based on a 12-bit downcounter and an 8-bit prescaler. It is clocked from an independent 32 kHz internal RC (LSI) and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free running timer for application timeout management. It is hardware or software configurable through the option bytes. The counter can be frozen in debug mode.

3.17.5 System window watchdog (WWDG)

The window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

3.17.6 SysTick timer

This timer is dedicated to real-time operating systems, but could also be used as a standard down counter. It features:

- a 24-bit down counter
- autoreload capability
- a maskable system interrupt generation when the counter reaches 0
- a programmable clock source.

3.18 Real-time clock (RTC) and backup registers

The RTC is an independent BCD timer/counter, supporting the following features:

- Calendar with subsecond, seconds, minutes, hours (12 or 24 format), week day, date, month, year, in BCD (binary-coded decimal) format.
- Automatic correction for 28, 29 (leap year), 30, and 31 days of the month.
- Two programmable alarms.
- On-the-fly correction from 1 to 32767 RTC clock pulses. This can be used to synchronize it with a master clock.
- Reference clock detection: a more precise second source clock (50 or 60 Hz) can be used to enhance the calendar precision.
- Digital calibration circuit with 0.95 ppm resolution, to compensate for quartz crystal inaccuracy.
- One anti-tamper detection pin with programmable filter.
- Timestamp feature, which can be used to save the calendar content. This function can be triggered by an event on the timestamp pin, or by a tamper event, or by a switch to VBAT mode.
- 17-bit auto-reload wake-up timer (WUT) for periodic events with programmable resolution and period.

The RTC and the 20 backup registers are supplied through a switch that takes power either from the V_{DD} supply (when present) or from the VBAT pin.

The backup registers are 32-bit registers used to store 80 bytes of user application data when V_{DD} power is not present. They are not reset by a system or power reset, or when the device wakes up from Standby or Shutdown mode.

The RTC clock sources can be:

- a 32.768 kHz external crystal (LSE)
- an external resonator or oscillator (LSE)
- one of the internal low power RC oscillators (LSI1 with typical frequency of 32 kHz or LSI2)
- the high-speed external clock (HSE) divided by 32.

The RTC is functional in VBAT mode and in all low-power modes when it is clocked by the LSE. When clocked by one of the LSIs, the RTC is not functional in VBAT mode, but is functional in all low-power modes except Shutdown mode.

All RTC events (alarm, wake-up timer, timestamp or tamper) can generate an interrupt and wake-up the device from the low-power modes.

3.19 Inter-integrated circuit interface (I2C)

The device embeds one I2C. Refer to [Table 12](#) for the features implementation.

The I²C bus interface handles communications between the microcontroller and the serial I²C bus. It controls all I²C bus-specific sequencing, protocol, arbitration and timing.

The I2C peripheral supports:

- I²C-bus specification and user manual rev. 5 compatibility:
 - Slave and master modes, multimaster capability
 - Standard-mode (Sm), with a bitrate up to 100 kbit/s
 - Fast-mode (Fm), with a bitrate up to 400 kbit/s
 - Fast-mode Plus (Fm+), with a bitrate up to 1 Mbit/s and 20 mA output drive I/Os
 - 7-bit and 10-bit addressing mode, multiple 7-bit slave addresses
 - Programmable setup and hold times
 - Optional clock stretching
- System Management Bus (SMBus) specification rev 2.0 compatibility:
 - Hardware PEC (packet error checking) generation and verification with ACK control
 - Address resolution protocol (ARP) support
 - SMBus alert
- Power System Management Protocol (PMBus™) specification rev 1.1 compatibility
- Independent clock: a choice of independent clock sources allowing the I2C communication speed to be independent from the PCLK reprogramming. Refer to [Figure 6: Clock tree](#).
- Wake-up from Stop mode on address match
- Programmable analog and digital noise filters
- 1-byte buffer with DMA capability

Table 12. I2C implementation

I2C features ⁽¹⁾	I2C1
Standard-mode (up to 100 kbit/s)	X
Fast-mode (up to 400 kbit/s)	X
Fast-mode Plus with 20 mA output drive I/Os (up to 1 Mbit/s)	X
Programmable analog and digital noise filters	X
SMBus/PMBus hardware support	X
Independent clock	X
Wake-up from Stop 0 / Stop 1 mode on address match	X

1. X: supported.

3.20 Universal synchronous/asynchronous receiver transmitter (USART)

The device embeds one universal synchronous receiver transmitter.

This interface provides asynchronous communication, IrDA SIR ENDEC support, multiprocessor communication mode, single-wire half-duplex communication mode and has LIN master/slave capability. It provides hardware management of the CTS and RTS signals, and RS485 driver enable.

The USART is able to communicate at speeds of up to 4 Mbit/s, and also provides Smart Card mode (ISO 7816 compliant) and SPI-like communication capability.

The USART supports synchronous operation (SPI mode), and can be used as an SPI master.

The USART has a clock domain independent from the CPU clock, allowing it to wake up the MCU from Stop mode using baudrates up to 200 kbaud. The wake up events from Stop mode are programmable and can be:

- the start bit detection
- any received data frame
- a specific programmed data frame.

The USART interface can be served by the DMA controller.

3.21 Serial peripheral interface (SPI1)

The SPI interface enable communication up to 32 Mbit/s in master and up to 24 Mbit/s in slave modes, in half-duplex, full-duplex and simplex modes. The 3-bit prescaler gives 8 master mode frequencies and the frame size is configurable from 4 bits to 16 bits. The SPI interface support NSS pulse mode, TI mode and Hardware CRC calculation.

The SPI interface can be served by the DMA controller.

3.22 Development support

3.22.1 Serial wire JTAG debug port (SWJ-DP)

The embedded Arm® SWJ-DP interface is a combined JTAG and serial wire debug port that enables either a serial wire debug, or a JTAG probe to be connected to the target.

Debug is performed using only two pins instead of the five required by the JTAG (JTAG pins can then be reused as GPIOs with alternate function): the JTAG TMS and TCK pins are shared with SWDIO and SWCLK, respectively, and a specific sequence on the TMS pin is used to switch between JTAG-DP and SW-DP.

4 Pinouts and pin description

Figure 7. STM32WB10CCU UFQFPN48 pinout ⁽¹⁾ ⁽²⁾

1. The above figure shows the package top view.
2. The exposed pad must be connected to ground plane.

Table 13. Legend/abbreviations used in the pinout table

Name		Abbreviation	Definition
Pin name		Unless otherwise specified in brackets below the pin name, the pin function during and after reset is the same as the actual pin name	
Pin type		S	Supply pin
		I	Input only pin
		I/O	Input / output pin
I/O structure		FT	5 V tolerant I/O
		TT	3.6 V tolerant I/O
		RF	RF I/O
		NRST	Bidirectional reset pin with weak pull-up resistor
		Option for TT or FT I/Os	
		_f ⁽¹⁾	I/O, Fm+ capable
		_a ^{(2) (3)}	I/O, with analog switch function supplied by V _{DDA}
Notes		Unless otherwise specified by a note, all I/Os are set as analog inputs during and after reset.	
Pin function	Alternate functions	Functions selected through GPIOx_AFR registers	
	Additional functions	Functions directly selected/enabled through peripheral registers	

1. The related I/O structures in [Table 14](#) are FT_f and FT_fa.
2. The related I/O structures in [Table 14](#) are FT_a, FT_la, FT_fa and TT_a.
3. The analog switch for the TSC function is supplied by V_{DD}.

Table 14. STM32WB10CC pin definitions

1. PC14 and PC15 are supplied through the power switch. As this switch only sinks a limited current (3 mA), the use of PC14 and PC15 GPIOs in output mode is limited:
 - the speed must not exceed 2 MHz with a maximum load of 30 pF
 - these GPIOs must not be used as current sources (e.g. to drive an LED).After a Backup domain power-up PC14 and PC15 operate as GPIOs. Their function depends on the content of the RTC registers not reset by the system reset. For details on how to manage these GPIOs, refer to the Backup domain and RTC register description in RM0478, available on www.st.com.
2. The clock on LSCO is available in Run and Stop modes, and on PA2 in Standby and Shutdown modes.
3. NRST pin is FT-tolerant if configured as PB11 GPIO.
4. RF pin, use the nominal PCB layout.
5. 32 MHz oscillator pins, use the nominal PCB layout according to reference design (see AN5165 available on www.st.com).
6. Reserved for production, must be kept unconnected.
7. High frequency (above 32 kHz) may impact the RF performance. Set output speed GPIOB_OSPEEDRy[1:0] to 00 (y = 0 and 1) during RF operation.
8. After reset this pin is configured as JTAG/SW debug alternate function, and the internal pull-up on PA15, PA13 and PB4 pins and the internal pull-down on PA14 pin are activated.
9. PB5 pin is configured as input with pull-up active under reset if NRST pin is active (external or internal reset).

5 Memory mapping

The STM32WB10CC devices feature a single physical address space that can be accessed by the application processor and by the RF subsystem.

A part of the Flash memory and of the SRAM2a and SRAM2b is made secure, exclusively accessible by the CPU2, protected against execution, read and write from CPU1 and DMA.

In case of shared resources the SW has to implement arbitration mechanism to avoid access conflicts. This happens for peripherals Reset and clock controller (RCC), Power controller (PWC), EXTI and Flash memory interface, and can be implemented using the built-in semaphore block (HSEM).

By default the RF subsystem and the CPU2 operate in secure mode. This implies that part of the Flash and of the SRAM2 memories can only be accessed by the RF subsystem and by the CPU2. In this case the Host processor (CPU1) has no access to these resources.

The detailed memory map and the peripheral mapping of the STM32WB10CC can be found in the reference manual RM0478.

6 Electrical characteristics

6.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to V_{SS} .

6.1.1 Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at $T_A = 25\text{ }^{\circ}\text{C}$ and $T_A = T_{A\text{max}}$ (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean $\pm 3\sigma$).

6.1.2 Typical values

Unless otherwise specified, typical data are based on $V_{DD} = V_{DDA} = V_{DDRF} = 3\text{ V}$ and $T_A = 25\text{ }^{\circ}\text{C}$. They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean $\pm 2\sigma$).

6.1.3 Typical curves

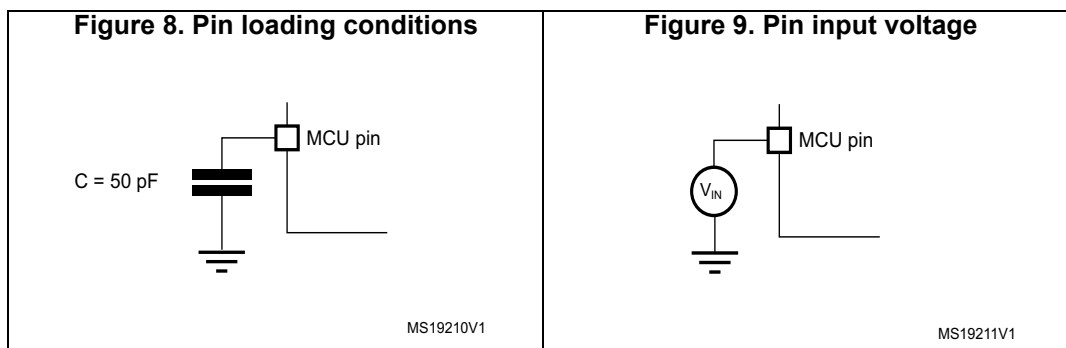

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

6.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 8](#).

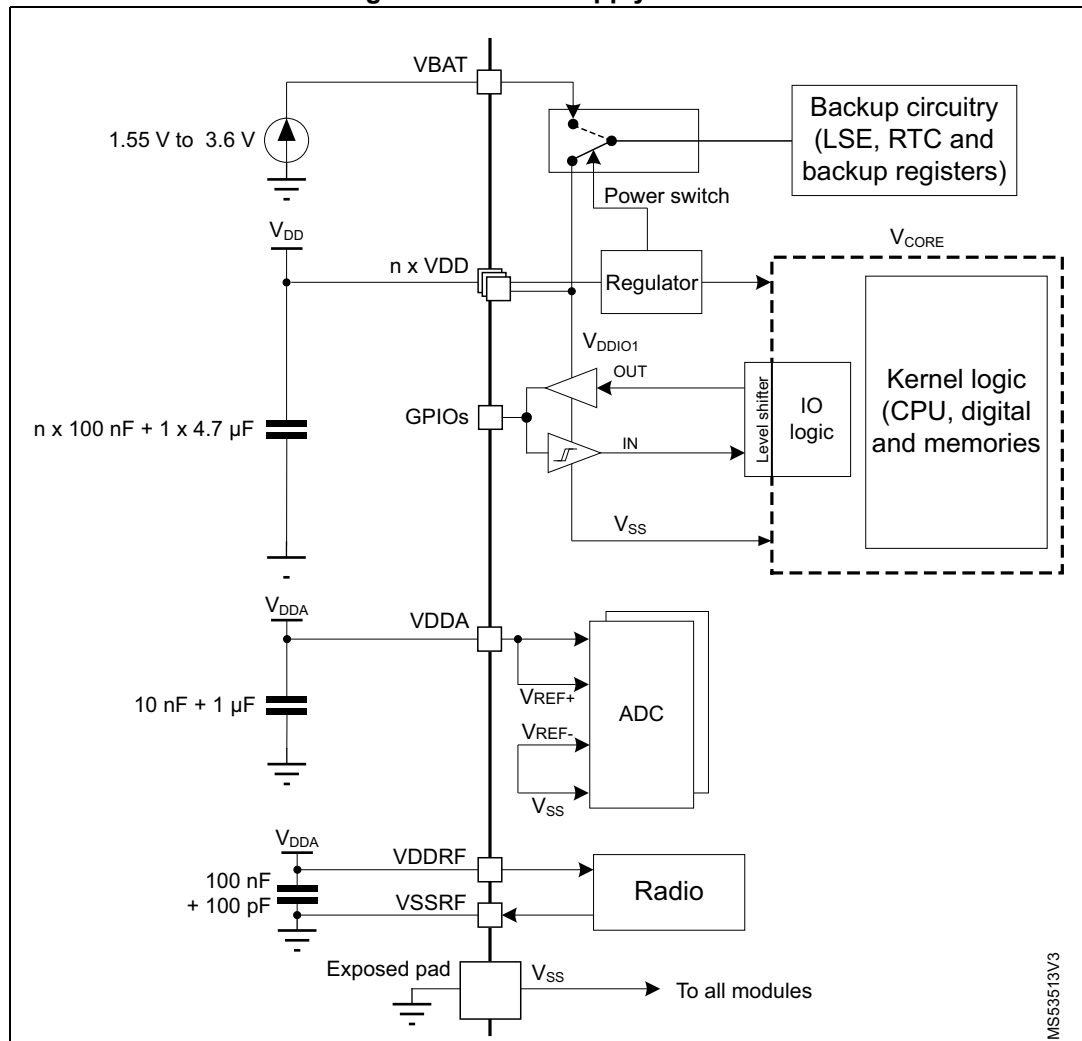

6.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 9](#).

6.1.6 Power supply scheme

Figure 10. Power supply scheme

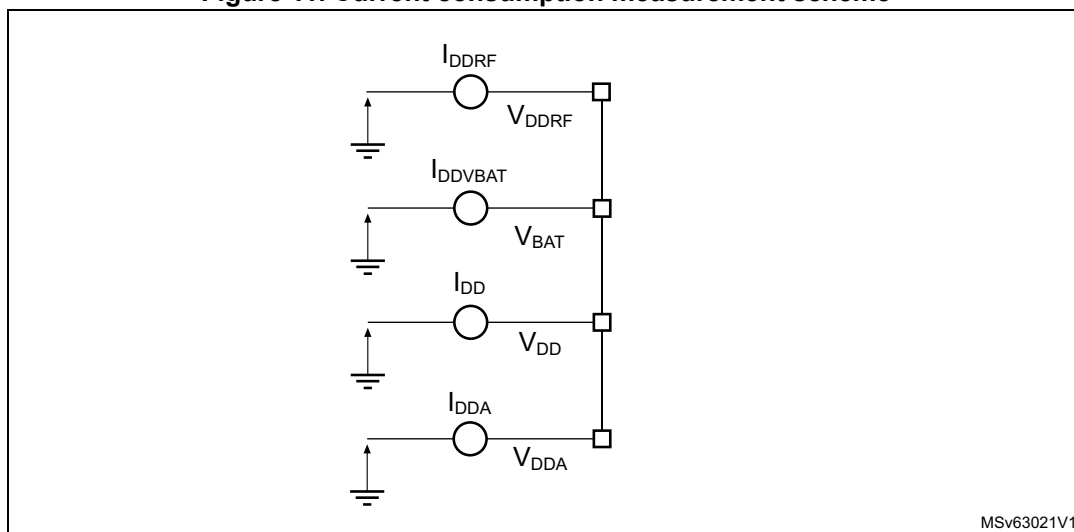

1. The value of L1 depends upon the frequency, as indicated in [Table 4: Typical external components](#).

Caution: Each power supply pair (e.g. V_{DD} / V_{SS} , V_{DDRF} / V_{SSRF}) must be decoupled with filtering ceramic capacitors as shown in [Figure 10](#). These capacitors must be placed as close as possible to (or below) the appropriate pins on the underside of the PCB to ensure the good functionality of the device.

6.1.7 Current consumption measurement

Figure 11. Current consumption measurement scheme

6.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 16](#), [Table 17](#) and [Table 18](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Device mission profile (application conditions) is compliant with JEDEC JESD47 Qualification standard, extended mission profiles are available on demand.

Table 16. Voltage characteristics⁽¹⁾

Symbol	Ratings	Min	Max	Unit
$V_{DDX} - V_{SS}$	External main supply voltage (including V_{DD} , V_{DDA} , V_{DDRF} , V_{BAT})	-0.3	4.0	V
$V_{IN}^{(2)}$	Input voltage on FT_XXX pins	$V_{SS} - 0.3$	$\min(V_{DD}, V_{DDA}, V_{DDRF}) + 4.0^{(3)(4)}$	
	Input voltage on TT_XX pins		4.0	
	Input voltage on any other pin		4.0	
$ \Delta V_{DDx} $	Variation between different V_{DDX} power pins of the same domain	-	50	mV
$ V_{SSx} - V_{SS} $	Variation between all the different ground pins	-	50	

1. All main power (V_{DD} , V_{DDRF} , V_{DDA} , V_{BAT}) and ground (V_{SS} , V_{SSRF}) pins must always be connected to the external power supply, in the permitted range.
2. V_{IN} maximum must always be respected. Refer to [Table 17](#) for the maximum allowed injected current values.
3. This formula must be applied only on the power supplies related to the IO structures described in the pin definition table.
4. To sustain a voltage higher than 4 V the internal pull-up/pull-down resistors must be disabled.

Table 17. Current characteristics

Symbol	Ratings	Max	Unit
$\sum I_{V_{DD}}$	Total current into sum of all V_{DD} power lines (source) ⁽¹⁾	130	mA
$\sum I_{V_{SS}}$	Total current out of sum of all V_{SS} ground lines (sink) ⁽¹⁾	130	
$I_{V_{DD}(PIN)}$	Maximum current into each V_{DD} power pin (source) ⁽¹⁾	100	
$I_{V_{SS}(PIN)}$	Maximum current out of each V_{SS} ground pin (sink) ⁽¹⁾	100	
$I_{IO(PIN)}$	Output current sunk by any I/O and control pin except FT_f	20	
	Output current sunk by any FT_f pin	20	
	Output current sourced by any I/O and control pin	20	
$\sum I_{IO(PIN)}$	Total output current sunk by sum of all I/Os and control pins ⁽²⁾	100	
	Total output current sourced by sum of all I/Os and control pins ⁽²⁾	100	
$I_{INJ(PIN)}^{(3)}$	Injected current on FT_xxx, TT_xx, NRST and B pins, except PB0 and PB1	-5 / +0 ⁽⁴⁾	
	Injected current on PB0 and PB1	-5/0	
$\sum I_{INJ(PIN)} $	Total injected current (sum of all I/Os and control pins) ⁽⁵⁾	25	

1. All main power (V_{DD} , V_{DDRF} , V_{DDA} , V_{BAT}) and ground (V_{SS} , V_{SSRF}) pins must always be connected to the external power supplies, in the permitted range.
2. This current consumption must be correctly distributed over all I/Os and control pins. The total output current must not be sunk/sourced between two consecutive power supply pins referring to high pin count packages.
3. Positive injection (when $V_{IN} > V_{DD}$) is not possible on these I/Os and does not occur for input voltages lower than the specified maximum value.
4. A negative injection is induced by $V_{IN} < V_{SS}$. $I_{INJ(PIN)}$ must never be exceeded. Refer also to [Table 16: Voltage characteristics](#) for the maximum allowed input voltage values.
5. When several inputs are submitted to a current injection, the maximum $\sum |I_{INJ(PIN)}|$ is the absolute sum of the negative injected currents (instantaneous values).

Table 18. Thermal characteristics

Symbol	Ratings	Value	Unit
T_{STG}	Storage temperature range	-65 to +150	°C
T_J	Maximum junction temperature	130	

6.3 Operating conditions

6.3.1 Summary of main performance

Table 19. Main performance at $V_{DD} = 3.3\text{ V}$

Parameter			Test conditions	Typ	Unit
I_{CORE}	Core current consumption		VBAT ($V_{BAT} = 1.8\text{ V}$, $V_{DD} = 0\text{ V}$)	0.002	μA
			Shutdown ($V_{DD} = 2.0\text{ V}$)	0.018	
			Standby ($V_{DD} = 3.0\text{ V}$, 48 Kbytes RAM retention)	0.340	
			Sleep (16 MHz)	0.610	
			LP run (2 MHz)	175	
			Run (64 MHz)	5850	
			Radio RX ⁽¹⁾	7700	
			Radio TX 0 dBm output power ⁽¹⁾	8600	
I_{PERI}	Peripheral current consumption	BLE	Advertising ⁽²⁾ with Stop1 (Tx = 0 dBm, period 1.28 s, 31 bytes, 3 channels)	19.2	
			Advertising ⁽²⁾ with Stop1 (Tx = 0 dBm, 6 bytes, period 1.24 s, 3 channels)	6	
			Advertising ⁽²⁾ with Standby and LDO configuration (Tx = 0 dBm, period 1.28 s, 31 bytes, 3 channels)	16.2	
			Advertising ⁽²⁾ with Standby and LDO configuration (Tx = 0 dBm, 6 bytes, period 10.24 s, 3 channels)	2.3	
		LP timers	-	5.800	
		RTC	-	1.750	

1. Power consumption including RF subsystem and digital processing.

2. Power consumption averaged over 300 s including Cortex M4, RF subsystem, digital processing and Cortex M0+.

6.3.2 General operating conditions

Table 20. General operating conditions

Symbol	Parameter	Conditions	Min	Max	Unit
f _{HCLK}	Internal AHB clock frequency	-	0	64	MHz
f _{PCLK1}	Internal APB1 clock frequency	-			
f _{PCLK2}	Internal APB2 clock frequency	-			
V _{DD}	Standard operating voltage	-	2.0 ⁽¹⁾	3.6	V
V _{DDA}	Analog supply voltage	ADC used	2.0		
		ADC not used ⁽²⁾	2.0		
V _{BAT}	Backup operating voltage	-	1.55	3.6	
V _{DDRF}	Minimum RF voltage	-	2.0		

Table 20. General operating conditions (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
V_{IN}	I/O input voltage	TT_xx I/O	-0.3	$V_{DD} + 0.3$	V
		All I/O except TT_xx	-0.3	$\min(\min(V_{DD}, V_{DDA}) + 3.6\text{ V}, 5.5\text{ V})^{(3)(4)}$	
P_D	Power dissipation	UFQFPN48	-	722	mW
T_A	Ambient temperature for suffix 5 version	Maximum power dissipation	-10	85	°C
		Low-power dissipation ⁽⁵⁾		105	
T_J	Junction temperature range	Suffix 5 version	-10	105	

- When RESET is released functionality is guaranteed down to V_{BOR0} Min.
- When not used, V_{DDA} must be connected to V_{DD} .
- This formula has to be applied only on the power supplies related to the IO structure described by the pin definition table. Maximum I/O input voltage is the smallest value between $\min(V_{DD}, V_{DDA}) + 3.6\text{ V}$ and 5.5 V .
- For operation with voltage higher than $\min(V_{DD}, V_{DDA}) + 0.3\text{ V}$, the internal pull-up and pull-down resistors must be disabled.
- In low-power dissipation state, T_A can be extended to this range as long as T_J does not exceed T_{Jmax} (see [Section 7.3: Thermal characteristics](#)).

6.3.3 RF BLE characteristics

RF characteristics are given at 1 Mbps, unless otherwise specified.

Table 21. RF transmitter BLE characteristics

Symbol	Parameter	Test conditions	Min	Typ	Max	Unit
F_{op}	Frequency operating range	-	2402	-	2480	MHz
F_{xtal}	Crystal frequency	-	-	32	-	
ΔF	Delta frequency	-	-	250	-	kHz
R_{gfsk}	On air data rate	-	-	1	-	Mbps
PLLres	RF channel spacing	-	-	2	-	MHz

Table 22. RF transmitter BLE characteristics (1 Mbps)⁽¹⁾

Symbol	Parameter	Test conditions	Min	Typ	Max	Unit
P_{rf}	Maximum output power	-	-	4.0	-	dBm
	0 dBm output power	-	-	0	-	
	Minimum output power	-	-	-20	-	
P_{band}	Output power variation over the band	Tx = 0 dBm - Typical	-0.5	-	0.4	dB
BW6dB	6 dB signal bandwidth	Tx = max output power	-	670	-	kHz
IBSE	In band spurious emission	2 MHz	Bluetooth® Low Energy: -20 dBm	-	-50	dBm
		≥ 3 MHz	Bluetooth® Low Energy: -30 dBm	-	-53	
f_d	Frequency drift	Bluetooth® Low Energy: ±50 kHz	-50	-	+50	kHz

Table 22. RF transmitter BLE characteristics (1 Mbps)⁽¹⁾ (continued)

Symbol	Parameter	Test conditions	Min	Typ	Max	Unit
maxdr	Maximum drift rate	Bluetooth® Low Energy: ±20 kHz / 50 µs	-20	-	+20	kHz/ 50 µs
fo	Frequency offset	Bluetooth® Low Energy: ±150 kHz	-150	-	+150	kHz
Δf1	Frequency deviation average	Bluetooth® Low Energy: between 225 and 275 kHz	225	-	275	
Δfa	Frequency deviation Δf2 (average) / Δf1 (average)	Bluetooth® Low Energy:> 0.80	0.80	-	-	-
OBSE ⁽²⁾	Out of band spurious emission	< 1 GHz	-	-	-62	dBm
		≥ 1 GHz	-	-	-45	

1. Measured in conducted mode, based on reference design (see AN5165), using output power specific external RF filter and impedance matching networks to interface with a 50 Ω antenna.
2. Suitable for systems targeting compliance with worldwide radio-frequency regulations ETSI EN 300 328 and EN 300 440 Class 2 (Europe), FCC CFR47 Part 15 (US), and ARIB STD-T66 (Japan).

Table 23. RF receiver BLE characteristics (1 Mbps)

Symbol	Parameter	Test conditions	Typ	Unit
Prx_max	Maximum input signal	PER <30.8% Bluetooth® Low Energy: min -10 dBm	-4	dBm
Psens ⁽¹⁾	High sensitivity mode	PER <30.8% Bluetooth® Low Energy: max -70 dBm	-95.5	
Rssi_maxrange	RSSI maximum value	-	-7	
Rssi_minrange	RSSI minimum value	-	-94	
Rssi_accu	RSSI accuracy	-	2	dB
C/Ico	Co-channel rejection	Bluetooth® Low Energy: 21 dB	9

P_IMD	Intermodulation	$ f_2 - f_1 = 3$ MHz Bluetooth® Low Energy: -50 dBm	-36	dBm
		$ f_2 - f_1 = 4$ MHz Bluetooth® Low Energy: -50 dBm	-35	
		$ f_2 - f_1 = 5$ MHz Bluetooth® Low Energy: -50 dBm	-33	
P_OBB	Out of band blocking	30 to 2000 MHz Bluetooth® Low Energy: -30 dBm	-2	dBm
		2003 to 2399 MHz Bluetooth® Low Energy: -35 dBm	-8	
		2484 to 2997 MHz Bluetooth® Low Energy: -35 dBm	-4	
		3 to 12.75 GHz Bluetooth® Low Energy: -30 dBm	6	

1. With ideal TX.

Table 24. RF BLE power consumption for $V_{DD} = 3.3$ V⁽¹⁾

Symbol	Parameter	Typ	Unit
I_{txmax}	TX maximum output power consumption	11.3	mA
I_{tx0dbm}	TX 0 dBm output power consumption	8.6	
I_{rxlo}	Rx consumption	7.7	

1. Power consumption including RF subsystem and digital processing.

6.3.4 Operating conditions at power-up / power-down

The parameters given in [Table 25](#) are derived from tests performed under the ambient temperature condition summarized in [Table 20](#).

Table 25. Operating conditions at power-up / power-down

Symbol	Parameter	Conditions	Min	Max	Unit
t_{VDD}	V_{DD} rise time rate	-	-	∞	$\mu\text{s/V}$
	V_{DD} fall time rate		10	∞	
t_{VDDA}	V_{DDA} rise time rate	-	0	∞	
	V_{DDA} fall time rate		10	∞	
t_{VDDRF}	V_{DDRF} rise time rate	-	-	∞	
	V_{DDRF} fall time rate		-	∞	

6.3.5 Embedded reset and power control block characteristics

The parameters given in [Table 26](#) are derived from tests performed under the ambient temperature conditions summarized in [Table 20: General operating conditions](#).

Table 26. Embedded reset and power control block characteristics

Symbol	Parameter	Conditions ⁽¹⁾	Min	Typ	Max	Unit
$t_{RSTTEMPO}^{(2)}$	Reset temporization after BOR0 is detected	V_{DD} rising	-	250	400	μs
$V_{BOR0}^{(2)}$	Brown-out reset threshold 0	Rising edge	1.62	1.66	1.70	V
		Falling edge	1.60	1.64	1.69	
V_{BOR1}	Brown-out reset threshold 1	Rising edge	2.06	2.10	2.14	
		Falling edge	1.96	2.00	2.04	
V_{BOR2}	Brown-out reset threshold 2	Rising edge	2.26	2.31	2.35	
		Falling edge	2.16	2.20	2.24	
V_{BOR3}	Brown-out reset threshold 3	Rising edge	2.56	2.61	2.66	
		Falling edge	2.47	2.52	2.57	
V_{BOR4}	Brown-out reset threshold 4	Rising edge	2.85	2.90	2.95	
		Falling edge	2.76	2.81	2.86	
V_{PVD0}	Programmable voltage detector threshold 0	Rising edge	2.10	2.15	2.19	
		Falling edge	2.00	2.05	2.10	
V_{PVD1}	PVD threshold 1	Rising edge	2.26	2.31	2.36	
		Falling edge	2.15	2.20	2.25	
V_{PVD2}	PVD threshold 2	Rising edge	2.41	2.46	2.51	
		Falling edge	2.31	2.36	2.41	

Table 26. Embedded reset and power control block characteristics (continued)

Symbol	Parameter	Conditions ⁽¹⁾	Min	Typ	Max	Unit
V_{PVD3}	PVD threshold 3	Rising edge	2.56	2.61	2.66	V
		Falling edge	2.47	2.52	2.57	
V_{PVD4}	PVD threshold 4	Rising edge	2.69	2.74	2.79	
		Falling edge	2.59	2.64	2.69	
V_{PVD5}	PVD threshold 5	Rising edge	2.85	2.91	2.96	
		Falling edge	2.75	2.81	2.86	
V_{PVD6}	PVD threshold 6	Rising edge	2.92	2.98	3.04	
		Falling edge	2.84	2.90	2.96	
V_{hyst_BORH0}	Hysteresis voltage of BORH0	Hysteresis in continuous mode	-	20	-	mV
		Hysteresis in other mode	-	30	-	
$V_{hyst_BOR_PVD}$	Hysteresis voltage of BORH (except BORH0) and PVD	-	-	100	-	
$I_{DD} (BOR_PVD)^{(2)}$	BOR ⁽³⁾ (except BOR0) and PVD consumption from V_{DD}	-	-	1.1	1.6	μA

1. Continuous mode means Run/Sleep modes, or temperature sensor enable in Low-power run/Low-power sleep modes.

2. Specified by design, not tested in production.

3. BOR0 is enabled in all modes (except shutdown) and its consumption is therefore included in the supply current characteristics tables.

6.3.6 Embedded voltage reference

The parameters given in [Table 27](#) are derived from tests performed under ambient temperature and supply voltage conditions summarized in [Table 20: General operating conditions](#).

Table 27. Embedded internal voltage reference

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{REFINT}	Internal reference voltage	$-10\text{ }^{\circ}\text{C} < T_J < +105\text{ }^{\circ}\text{C}$	1.182	1.212	1.232	V
$t_{S_vrefint}^{(1)}$	ADC sampling time when reading the internal reference voltage	-	4 ⁽²⁾	-	-	μs
$t_{start_vrefint}$	Start time of reference voltage buffer when ADC is enabled	-	-	8	12 ⁽²⁾	
$I_{DD}(V_{REFINTBUF})$	V_{REFINT} buffer consumption from V_{DD} when converted by ADC	-	-	12.5	20 ⁽²⁾	μA
ΔV_{REFINT}	Internal reference voltage spread over the temperature range	$V_{DD} = 3\text{ V}$	-	5	7.5 ⁽²⁾	mV
T_{Coeff}	Temperature coefficient	$-10\text{ }^{\circ}\text{C} < T_J < +105\text{ }^{\circ}\text{C}$	-	30	50 ⁽²⁾	ppm/ $^{\circ}\text{C}$
A_{Coeff}	Long term stability	1000 hours, $T_J = 25\text{ }^{\circ}\text{C}$	-	300	1000 ⁽²⁾	ppm
$V_{DDCcoeff}$	Voltage coefficient	$3.0\text{ V} < V_{DD} < 3.6\text{ V}$	-	250	1200 ⁽²⁾	ppm/V
V_{REFINT_DIV1}	1/4 reference voltage	-	24	25	26	% V_{REFINT}
V_{REFINT_DIV2}	1/2 reference voltage		49	50	51	
V_{REFINT_DIV3}	3/4 reference voltage		74	75	76	

1. The shortest sampling time can be determined in the application by multiple iterations.
2. Specified by design, not tested in production.

Figure 12. V_{REFINT} vs. temperature

6.3.7 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in [Figure 11: Current consumption measurement scheme](#).

Typical and maximum current consumption

The MCU is put under the following conditions:

- All I/O pins are in analog input mode
- All peripherals are disabled except when explicitly mentioned
- The flash memory access time is adjusted with the minimum wait states number, depending on the f_{HCLK} frequency (refer to the table “Number of wait states according to CPU clock (HCLK) frequency” available in the RM0478 reference manual).
- When the peripherals are enabled $f_{PCLK} = f_{HCLK}$
- For flash memory and shared peripherals $f_{PCLK} = f_{HCLK} = f_{HCLKS}$

The parameters given in [Table 28](#) to [Table 38](#) are derived from tests performed under ambient temperature and supply voltage conditions summarized in [Table 20: General operating conditions](#).

Table 28. Current consumption in Run and Low-power run modes, code with data processing running from flash memory, ART enable (Cache ON Prefetch OFF), $V_{DD} = 3.3\text{ V}$

Symbol	Parameter	Conditions	f_{HCLK}	Typ			Max ⁽¹⁾		Unit
				25 °C	55 °C	85 °C	25 °C	85 °C	
$I_{DD}(\text{Run})$	Supply current in Run mode	$f_{HCLK} = f_{HSI16}$ up to 16 MHz included, $f_{HCLK} = f_{HSE} = 32\text{ MHz}$ $f_{HSI16} + \text{PLL ON}$ above 32 MHz All peripherals disabled	64 MHz	6.35	6.40	6.45	7.25	7.37	mA
			32 MHz	3.25	3.30	3.35	3.29	3.53	
			16 MHz	1.75	1.75	1.80	2.06	2.18	
$I_{DD}(\text{LPRun})$	Supply current in Low-power run mode	$f_{HCLK} = f_{MSI}$ All peripherals disabled	2 MHz	0.190	0.205	0.235	0.270	0.460	
			1 MHz	0.105	0.115	0.145	0.170	0.320	
			400 kHz	0.051	0.0605	0.0905	0.080	0.230	
			100 kHz	0.024	0.034	0.0645	0.040	0.190	

1. Evaluated by characterization (mean $\pm 4\sigma$), not tested in production, unless otherwise specified.

Table 29. Current consumption in Run and Low-power run modes, code with data processing running from SRAM1, $V_{DD} = 3.3$ V

Symbol	Parameter	Conditions-	f_{HCLK}	Typ			Max ⁽¹⁾		Unit
				25 °C	55 °C	85 °C	25 °C	85 °C	
$I_{DD}(\text{Run})$	Supply current in Run mode	$f_{HCLK} = f_{HSI16}$ up to 16 MHz included, $f_{HCLK} = f_{HSE} = 32$ MHz $f_{HSI16} + \text{PLL ON}$ above 32 MHz All peripherals disabled	64 MHz	6.75	6.80	6.85	8.05	8.22	mA

I/O system current consumption

The current consumption of the I/O system has two components: static and dynamic.

I/O static current consumption

All the I/Os used as inputs with pull resistors generate current consumption when the pin is externally held to the opposite level. The value of this current can be computed using the pull-up/pull-down resistors values given in [Table 61: I/O static characteristics](#).

For the output pins, all internal or external pull-up/pull-down loads must be considered to estimate the current consumption.

Additional I/O current consumption is due to I/Os configured as inputs if an intermediate voltage level is applied externally. This current consumption is caused by the input Schmitt trigger circuits used to discriminate the input value. Unless this specific configuration is required by the application, this supply current consumption can be avoided by configuring these I/Os in analog mode. This is notably the case of ADC input pins, which should be configured as analog inputs.

Caution: Any floating input pin can also settle to an intermediate voltage level or switch inadvertently, as a result of external electromagnetic noise. To avoid current consumption related to floating pins, they must either be configured in analog mode, or forced internally to a definite digital value. This can be done either by using pull-up/down resistors or by configuring the pins in output mode.

I/O dynamic current consumption

In addition to the internal peripheral current consumption measured previously (see [Table 40](#)) the I/Os used by the application also contribute to the current consumption.

When an I/O pin switches, it uses the current from the I/O supply voltage to supply the I/O pin circuitry and to charge/discharge the capacitive load (internal and external) connected to the pin:

$$I_{SW} = V_{DD} \times f_{SW} \times C$$

- I_{SW} is the current sunk by a switching I/O to charge/discharge the capacitive load
- V_{DD} is the I/O supply voltage
- f_{SW} is the I/O switching frequency
- C is the total capacitance seen by the I/O pin: $C = C_{I/O} + C_{EXT}$
- $C_{I/O}$ is the I/O pin capacitance
- C_{EXT} is the PCB board capacitance plus any connected external device pin capacitance.

The test pin is configured in push-pull output mode, and is toggled by software at a fixed frequency.

On-chip peripheral current consumption

The current consumption of the on-chip peripherals is given in [Table 40](#). The MCU is placed under the following conditions:

- All I/O pins are in Analog mode
- The given value is calculated by measuring the difference of the current consumptions:
 - when the peripheral is clocked on
 - when the peripheral is clocked off
- Ambient operating temperature and supply voltage conditions summarized in [Table 16: Voltage characteristics](#)
- The power consumption of the digital part of the on-chip peripherals is given in [Table 40](#). The power consumption of the analog part of the peripherals (where applicable) is indicated in each related section of the datasheet.

Table 40. Peripheral current consumption

1. The BusMatrix is automatically active when at least one master is ON (CPU, DMA).
2. GPIOs consumption during read and write accesses.
3. The AHB to APB2 bridge is automatically active when at least one peripheral is ON on the APB2.

6.3.8 Wake-up time from Low-power modes and voltage scaling transition times

The wake-up times given in [Table 41](#) are the latency between the event and the execution of the first user instruction.

The device goes in Low-power mode after the WFE (Wait For Event) instruction.

Table 41. Low-power mode wake-up timings⁽¹⁾

Symbol	Parameter	Conditions	Typ	Max	Unit
$t_{WUSLEEP}$	Wake-up time from Sleep mode to Run mode	-	9	10	No. of CPU cycles
$t_{WULPSLEEP}$	Wake-up time from Low-power sleep mode to Low-power run mode	Wake-up in flash with memory in power-down during low-power sleep mode (FPDS = 1 in PWR_CR1) and with clock MSI = 2 MHz	9	10	

Table 41. Low-power mode wake-up timings⁽¹⁾ (continued)

1. Evaluated by characterization results ($V_{DD} = 3\text{ V}$, $T = 25\text{ }^{\circ}\text{C}$), not tested in production.

2. Time until REGLPF flag is cleared in PWR_SR2.

Table 43. Wake-up time using USART⁽¹⁾

Symbol	Parameter	Conditions	Typ	Max	Unit
$t_{WUUSART}$	Wake-up time needed to calculate the maximum USART baud rate allowing to wake-up from Stop modes when USART clock source is HSI16	Stop mode 0	-	1.7	μs
		Stop mode 1/2	-	8.5	

1. Specified by design, not tested in production.

6.3.9 External clock source characteristics

High-speed external user clock generated from an external source

The high-speed external (HSE) clock is supplied with a 32 MHz crystal oscillator, a sine or a square wave.

The STM32WB10CC includes internal programmable capacitances that can be used to tune the crystal frequency in order to compensate the PCB parasitic one.

The characteristics in [Table 44](#) and [Table 46](#) are measured over recommended operating conditions, unless otherwise specified. Typical values are referred to $T_A = 25\text{ }^{\circ}\text{C}$ and $V_{DD} = 3.0\text{ V}$.

Table 44. HSE crystal requirements⁽¹⁾

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{NOM}	Oscillator frequency	-	-	32	-	MHz
f_{TOL}	Frequency tolerance	Includes initial accuracy, stability over temperature, aging and frequency pulling due to incorrect load capacitance.	-	-	50	ppm
C_L	Load capacitance	-	6	-	8	pF
ESR	Equivalent series resistance	-	-	-	100	Ω
P_D	Drive level	-	-	-	100	μW

1. 32 MHz XTAL validated for specific reference NX2016SA. For additional information refer to AN 5165 "Development of RF hardware using STM32WB microcontrollers", available on www.st.com.

Table 45. HSE clock source requirements⁽¹⁾

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{HSE_ext}	User external clock source frequency	-	-	32	-	MHz
f_{TOLHSE}	Frequency tolerance	Includes initial accuracy, stability over temperature, aging.	-	-	50	ppm
V_{HSE}	Clock input voltage limit	Sine or square wave, AC coupled ⁽²⁾	0.4	-	1.6	V_{PP}
t_r, t_f	Rise and fall times	10%-90% square wave	-	-	$15 * V_{PP}$	ns
DuCy(HSE)	Duty cycle	-	45	50	55	%
$\phi_{n(HSE)}$	Phase noise for 32 MHz	Offset = 10 kHz	-	-	-127	dBc / Hz
		Offset = 100 kHz	-	-	-135	
		Offset = 1 MHz	-	-	-138	

1. Specified by design, not tested in production.
 2. Only AC coupling supported (capacitor 470 pF to 100 nF).

Table 46. HSE oscillator characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{SUA(HSE)}$	Startup time for 80% amplitude stabilization	V_{DDRF} stabilized, XOTUNE = 000000, -10 to +85 °C range	-	1000	-	μs
$t_{SUR(HSE)}$	Startup time for XOREADY signal	V_{DDRF} stabilized, XOTUNE = 000000, -10 to +85 °C range	-	250	-	
$I_{DDRF(HSE)}$	HSE current consumption ⁽¹⁾	HSEGMCM=000, XOTUNE = 000000	-	50	-	μA
$XOT_g(HSE)$	XOTUNE granularity	Capacitor bank	-	1	5	ppm
$XOT_{fp}(HSE)$	XOTUNE frequency pulling		± 20	± 40	-	
$XOT_{nb}(HSE)$	XOTUNE number of tuning bits		-	6	-	bit
$XOT_{st}(HSE)$	XOTUNE setting time		-	-	0.1	ms

1. Current consumption in standalone mode. The current consumption at device level is 350 μA in design simulation.

Note: For information about the trimming of the oscillator refer to AN5165 “Development of RF hardware using STM32WB microcontrollers”, available on www.st.com.

Low-speed external user clock generated from an external source

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal resonator oscillator. The information provided in this section is based on design simulation results obtained with typical external components specified in Table 47. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins to minimize output distortion and startup stabilization time.

Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 47. Low-speed external user clock characteristics⁽¹⁾

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{DD(LSE)}$	LSE current consumption	LSEDRV[1:0] = 00 Low drive capability	-	250	-	nA
		LSEDRV[1:0] = 01 Medium low drive capability	-	315	-	
		LSEDRV[1:0] = 10 Medium high drive capability	-	500	-	
		LSEDRV[1:0] = 11 High drive capability	-	630	-

		LSEDRV[1:0] = 01 Medium low drive capability	-	-	0.75	
		LSEDRV[1:0] = 10 Medium high drive capability	-	-	1.70	
		LSEDRV[1:0] = 11 High drive capability	-	-	2.70	

Table 47. Low-speed external user clock characteristics⁽¹⁾ (continued)

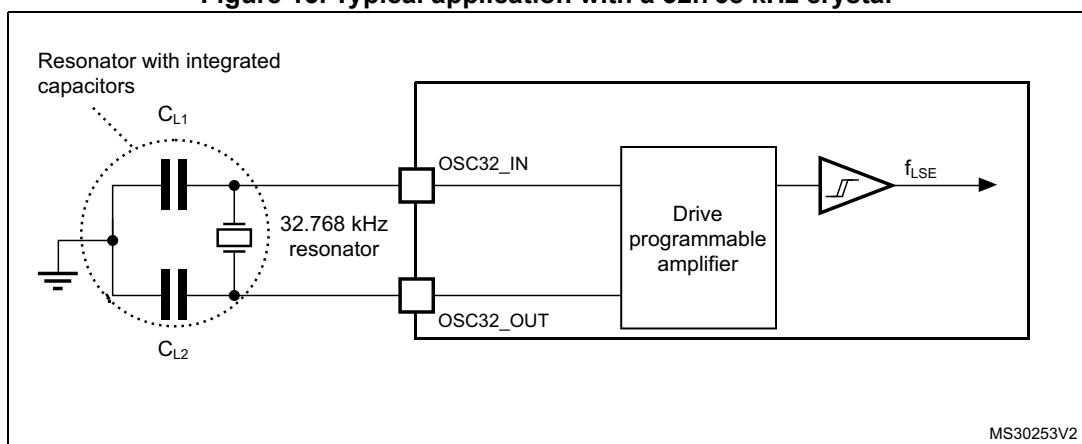

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{SU(LSE)}^{(2)}$	Startup time	V_{DD} stabilized	-	2	-	s
f_{tolLSE}	Frequency tolerance	Includes initial accuracy, stability over temperature, aging, and frequency pulling	-500	-	500	ppm

1. Specified by design, not tested in production.

2. $t_{SU(LSE)}$ is the startup time measured from the moment it is enabled (by software) until a stable 32 MHz oscillation is reached. This value is measured for a standard crystal and it can vary significantly with the crystal manufacturer.

Note: For information on selecting the crystal refer to application note AN2867 "Oscillator design guide for STM8S, STM8A and STM32 microcontrollers" available from www.st.com.

Figure 13. Typical application with a 32.768 kHz crystal

Note: No external resistors are required between $OSC32_IN$ and $OSC32_OUT$, and it is forbidden to add one.

In bypass mode the LSE oscillator is switched off and the input pin is a standard GPIO.

The external clock signal has to respect the I/O characteristics detailed in [Section 6.3.16](#).

The recommend clock input waveform is shown in [Figure 14](#).

Figure 14. Low-speed external clock source AC timing diagram

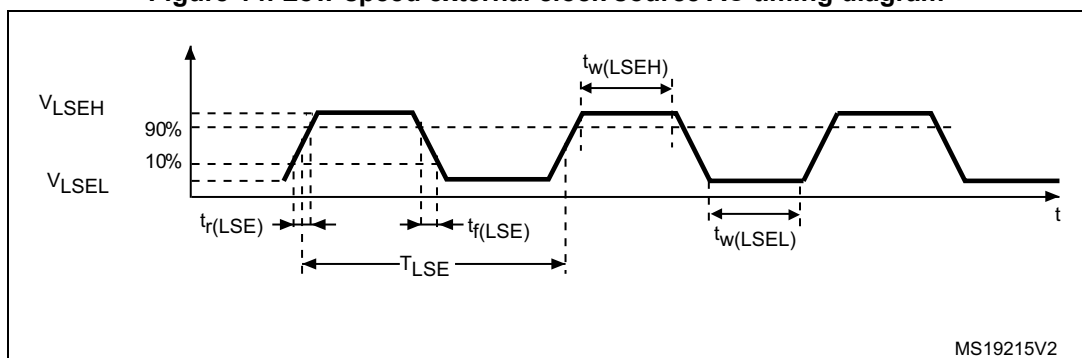

Table 48. Low-speed external user clock characteristics, bypass mode⁽¹⁾

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{LSE_ext}	User external clock source frequency	-	21.2	32.768	44.4	kHz

			Range 10	-	-	110	130
			Range 11	-	-	155	190

1. Evaluated by characterization, not tested in production.
2. This is a deviation for an individual part once the initial frequency has been measured.
3. Sampling mode means Low-power run/Low-power sleep modes with Temperature sensor disable.
4. Specified by design, not tested in production.

Figure 16. Typical current consumption vs. MSI frequency

Low-speed internal (LSI) RC oscillator

Table 51. LSI1 oscillator characteristics⁽¹⁾

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{LSI}	LSI1 frequency	$V_{DD} = 3.0\text{ V}$, $T_A = 30\text{ °C}$	31.04	-	32.96	kHz
		$V_{DD} = 2.0\text{ to }3.6\text{ V}$, $T_A = -10\text{ to }85\text{ °C}$	29.5	-	34	
$t_{SU}(LSI1)^{(2)}$	LSI1 oscillator start-up time	-	-	80	130	μs
$t_{STAB}(LSI1)^{(2)}$	LSI1 oscillator stabilization time	5% of final frequency	-	125	180	
$I_{DD}(LSI1)^{(2)}$	LSI1 oscillator power consumption	-	-	110	180	nA

1. Evaluated by characterization, not tested in production.

2. Specified by design, not tested in production.

Table 52. LSI2 oscillator characteristics⁽¹⁾

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{LSI2}	Frequency ⁽²⁾	$V_{DD} = 2.0\text{ to }3.6\text{ V}$, $T_A = -10\text{ to }85\text{ °C}$	22	32	48	kHz
$t_{SU}(LSI2)^{(3)}$	Start-up time	-	1	-	3.5	ms
$I_{DD}(LSI2)^{(3)}$	Power consumption	-	-	1	2	μA
$\Delta\text{TEMP}(LSI2)^{(4)}$	Stability over temperature	-	-200	-	200	ppm / °C

1. Evaluated by characterization, not tested in production.

2. LSI2 cannot be trimmed.

3. Specified by design, not tested in production, LSI2TRIM[3:0] field of register RCC_CSR = 0xC.

4. The ± 500 ppm performance is respected when the temperature variation is lower than 1 °C between two LSI2 frequency calibrations, with a maximum calibration interval of 4 s.

6.3.11 PLL characteristics

The parameters given in [Table 53](#) are derived from tests performed under temperature and V_{DD} supply voltage conditions summarized in [Table 20: General operating conditions](#).

Table 53. PLL characteristics⁽¹⁾

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{PLL_IN}	PLL input clock ⁽²⁾	-	2.66	-	16	MHz
	PLL input clock duty cycle	-	45	-	55	%
$f_{PLL_P_OUT}$	PLL multiplier output clock P	-	2	-	64	MHz
$f_{PLL_Q_OUT}$	PLL multiplier output clock Q	-	8	-	64	
$f_{PLL_R_OUT}$	PLL multiplier output clock R	-	8	-	64	
f_{VCO_OUT}	PLL VCO output	-	96	-	344	
t_{LOCK}	PLL lock time	-	-	15	40	μs
Jitter	RMS cycle-to-cycle jitter	System clock 64 MHz	-	40	-	ps
	RMS period jitter		-	30	-	

Table 53. PLL characteristics⁽¹⁾ (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
I _{DD} (PLL)	PLL power consumption on V _{DD} ⁽¹⁾	VCO freq = 96 MHz	-	200	260	μA
		VCO freq = 192 MHz	-	300	380	
		VCO freq = 344 MHz	-	520	650	

- Specified by design, not tested in production.
- Take care of using the appropriate division factor M to obtain the specified PLL input clock values. The M factor is shared between the two PLLs.

6.3.12 Flash memory characteristics

Table 54. Flash memory characteristics⁽¹⁾

Symbol	Parameter	Conditions	Typ	Max	Unit
t _{prog}	64-bit programming time	-	81.7	90.8	μs
t _{prog_row}	One row (64 double word) programming time	Normal programming	5.2	5.5	ms
		Fast programming	3.8	4.0	
t _{prog_page}	One page (2 Kbytes) programming time	Normal programming	41.8	43.0	
		Fast programming	30.4	31.0	
t _{ERASE}	Page (2 Kbytes) erase time	-	22.0	24.5	
t _{ME}	Mass erase time	-	22.1	25.0	
I _{DD}	Average consumption from V _{DD}	Write mode	3.4	-	mA
		Erase mode	3.4	-	

- Specified by design, not tested in production.

Table 55. Flash memory endurance and data retention

Symbol	Parameter	Conditions	Min ⁽¹⁾	Unit
N _{END}	Endurance	T _A = -10 to +85 °C	10	kcycles
t _{RET}	Data retention	1 kcycle ⁽²⁾ at T _A = 85 °C	30	Years
		10 kcycles ⁽²⁾ at T _A = 55 °C	30	
		10 kcycles ⁽²⁾ at T _A = 85 °C	15	

- Evaluated by characterization, not tested in production.
- Cycling performed over the whole temperature range.

6.3.13 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling two LEDs through I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- **FTB**: a burst of fast transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in [Table 56](#). They are based on the EMS levels and classes defined in application note AN1709 “*EMC design guide for STM8, STM32 and Legacy MCUs*”, available on www.st.com.

Table 56. EMS characteristics

Symbol	Parameter	Conditions	Level/Class
V_{FESD}	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$, $T_A = +25\text{ °C}$, $f_{HCLK} = 64\text{ MHz}$, conforming to IEC 61000-4-2	3B
V_{EFTB}	Fast transient voltage burst limits to be applied through 100 pF on V_{DD} and V_{SS} pins to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$, $T_A = +25\text{ °C}$, $f_{HCLK} = 64\text{ MHz}$, conforming to IEC 61000-4-4	5A

Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

Software recommendations

The software flow must include the management of runaway conditions such as:

- corrupted program counter
- unexpected reset
- critical data corruption (e.g. control registers)

Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the oscillator pins for 1 second.

To complete these trials, ESD stress is applied directly on the device, over the specified values range. When unexpected behavior is detected, the software can be hardened to

prevent the occurrence of unrecoverable errors (see AN1015 “*Software techniques for improving microcontrollers EMC performance*”, available on www.st.com).

Electromagnetic interference (EMI)

The electromagnetic field emitted by the device is monitored while a simple application is executed (toggling two LEDs through the I/O ports). This emission test is compliant with the IEC 61967-2 standard, which specifies the test board and the pin loading.

Table 57. EMI characteristics for f_{HSE} / f_{CPUM4} , f_{CPUM0} = 32 MHz / 64 MHz, 32 MHz

Symbol	Parameter	Conditions	Monitored frequency band	Peripheral ON	Unit
S_{EMI}	Peak ⁽¹⁾	$V_{DD} = 3.6$ V, $T_A = 25$ °C, UFQFPN48 package compliant with IEC 61967-2	0.1 MHz to 30 MHz	4	dBμV
			30 MHz to 130 MHz	8	
			130 MHz to 1 GHz	0	
			1 GHz to 2 GHz	9	
	Level ⁽²⁾		0.1 MHz to 2 GHz	1.5	-

1. Refer to AN1709, “EMI radiated test” section.

2. Refer to AN1709, “EMI level classification” section.

6.3.14 Electrical sensitivity characteristics

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed to determine its performance in terms of electrical sensitivity.

Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n + 1) supply pins). This test conforms to the ANSI/JEDEC standard.

Table 58. ESD absolute maximum ratings

Symbol	Ratings	Conditions	Class	Maximum value ⁽¹⁾	Unit
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	$T_A = +25$ °C, conforming to ANSI/ESDA/JEDEC JS-001	2	2000	V
$V_{ESD(CDM)}$	Electrostatic discharge voltage (charge device model)	$T_A = +25$ °C, conforming to ANSI/ESD STM5.3.1 JS-002	C2a	500	

1. Evaluated by characterization, not tested in production.

Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

- a supply overvoltage is applied to each power supply pin
- a current injection is applied to each input, output and configurable I/O pin.

These tests are compliant with EIA/JESD 78A IC latch-up standard.

Table 59. Electrical sensitivities

Symbol	Parameter	Conditions	Class
LU	Static latch-up class	$T_A = +105\text{ }^{\circ}\text{C}$ conforming to JESD78A	II

6.3.15 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below V_{SS} or above V_{DD} (for standard, 3.3 V-capable I/O pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

Functional susceptibility to I/O current injection

While a simple application is executed, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error above a certain limit (higher than 5 LSB TUE), out of conventional limits of induced leakage current on adjacent pins (out of the $-5/0\text{ }\mu\text{A}$ range) or other functional failure (for example reset occurrence or oscillator frequency deviation).

The characterization results are given in [Table 60](#).

Negative induced leakage current is caused by negative injection and positive induced leakage current is caused by positive injection.

Table 60. I/O current injection susceptibility⁽¹⁾

Symbol	Description	Functional susceptibility		Unit
		Negative injection	Positive injection	
I_{INJ}	Injected current on all pins, except AT0, AT1, PB0, and PB1	-5	N/A ⁽²⁾	mA
	Injected current on AT0, AT1, PB0, and PB1 pins	0	0	

1. Evaluated by characterization, not tested in production.

2. Injection not possible.

6.3.16 I/O port characteristics

General input/output characteristics

For information on GPIO configuration, refer to AN4899 “STM32 GPIO configuration for hardware settings and low-power consumption” available on www.st.com.

Unless otherwise specified, the parameters given in [Table 61](#) are derived from tests performed under the conditions summarized in [Table 20: General operating conditions](#). All I/Os are designed as CMOS- and TTL-compliant.

Table 61. I/O static characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IL}	I/O input low level voltage ⁽¹⁾	$2.0\text{ V} < V_{DD} < 3.6\text{ V}$	-	-	$0.3 \times V_{DD}$	V
	I/O input low level voltage ⁽¹⁾				$0.39 \times V_{DD} - 0.06$	
V_{IH}	I/O input high level voltage ⁽¹⁾		$0.7 \times V_{DD}$	-	-	
	I/O input high level voltage ⁽¹⁾		$0.49 \times V_{DD} + 0.26$	-	-	
V_{hys}	TT_xx, FT_xxx and NRST I/O input hysteresis		-	200	-	mV
I_{lkg}	FT_xx input leakage current	$0 \leq V_{IN} \leq \text{Max}(V_{DDXXX})^{(2)}$	-	-	± 100	nA
		$\text{Max}(V_{DDXXX}) \leq V_{IN} \leq \text{Max}(V_{DDXXX}) + 1\text{ V}^{(1)(2)(3)}$	-	-	650	
		$\text{Max}(V_{DDXXX}) + 1\text{ V} < V_{IN} \leq 5.5\text{ V}^{(1)(2)(3)(4)(5)}$	-	-	$200^{(6)}$	
	TT_xx input leakage current	$V_{IN} \leq \text{Max}(V_{DDXXX})^{(2)}$	-	-	± 150	
		$\text{Max}(V_{DDXXX}) \leq V_{IN} < 3.6\text{ V}^{(2)}$	-	-	2000	
R_{PU}	Weak pull-up equivalent resistor ⁽¹⁾	$V_{IN} = V_{SS}$	25	40	55	k Ω
R_{PD}	Weak pull-down equivalent resistor ⁽¹⁾	$V_{IN} = V_{DD}$	25	40	55	
C_{IO}	I/O pin capacitance ⁽⁷⁾	-	-	5	-	pF

1. Specified by design, not tested in production.

2. Represents the pad leakage of the I/O itself. The total product pad leakage is given by $I_{Total_leak_max} = 10\text{ }\mu\text{A} + \text{number of I/Os where } V_{IN} \text{ is applied on the pad} \times I_{lkg}(\text{Max})$.

3. $\text{Max}(V_{DDXXX})$ is the maximum value among all the I/O supplies.

4. V_{IN} must be lower than $[\text{Max}(V_{DDXXX}) + 3.6\text{ V}]$.

5. Refer to [Figure 17: I/O input characteristics](#).

6. To sustain a voltage higher than $\min(V_{DD}, V_{DDA}) + 0.3\text{ V}$, the internal pull-up and pull-down resistors must be disabled. All FT_xx I/Os.

7. RF I/O structure excluded.

All I/Os are CMOS- and TTL-compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology or TTL parameters, as shown in [Figure 17](#).

Figure 17. I/O input characteristics

Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to ± 8 mA, and sink or source up to ± 20 mA (with a relaxed V_{OL} / V_{OH}).

In the user application, the number of I/O pins that can drive current must be limited to respect the absolute maximum rating specified in [Section 6.2](#).

- The sum of the currents sourced by all the I/Os on V_{DD} , plus the maximum consumption of the MCU sourced on V_{DD} , cannot exceed the absolute maximum rating ΣI_{VDD} (see [Table 16: Voltage characteristics](#)).
- The sum of the currents sunk by all the I/Os on V_{SS} , plus the maximum consumption of the MCU sunk on V_{SS} , cannot exceed the absolute maximum rating ΣI_{VSS} (see [Table 16: Voltage characteristics](#)).

Output voltage levels

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature and supply voltage conditions summarized in [Table 20: General operating conditions](#). All I/Os are CMOS- and TTL-compliant (FT or TT unless otherwise specified).

Table 62. Output voltage characteristics⁽¹⁾

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{OL}^{(2)}$	Output low level voltage for an I/O pin	CMOS port ⁽³⁾ $ I_{IO} = 8 \text{ mA}$ $V_{DD} \geq 2.7 \text{ V}$	-	0.4	V
$V_{OH}^{(2)}$	Output high level voltage for an I/O pin		$V_{DD} - 0.4$	-	
$V_{OL}^{(2)}$	Output low level voltage for an I/O pin	TTL port ⁽³⁾ $ I_{IO} = 8 \text{ mA}$ $V_{DD} \geq 2.7 \text{ V}$	-	0.4	
$V_{OH}^{(2)}$	Output high level voltage for an I/O pin		2.4	-	
$V_{OL}^{(2)}$	Output low level voltage for an I/O pin	$ I_{IO} = 20 \text{ mA}$ $V_{DD} \geq 2.7 \text{ V}$	-	1.3	
$V_{OH}^{(2)}$	Output high level voltage for an I/O pin		$V_{DD} - 1.3$	-	
$V_{OL}^{(2)}$	Output low level voltage for an I/O pin	$ I_{IO} = 4 \text{ mA}$ $V_{DD} \geq 2.0 \text{ V}$	-	0.4	
$V_{OH}^{(2)}$	Output high level voltage for an I/O pin		$V_{DD} - 0.45$	-	
$V_{OLFM+}^{(2)}$	Output low level voltage for an FT I/O pin in FM+ mode (FT I/O with "f" option)	$ I_{IO} = 20 \text{ mA}$ $V_{DD} \geq 2.7 \text{ V}$	-	0.4	
		$ I_{IO} = 10 \text{ mA}$ $V_{DD} \geq 2.0 \text{ V}$	-	0.4	

1. The I_{IO} current sourced or sunk by the device must always respect the absolute maximum rating specified in [Table 16: Voltage characteristics](#), and the sum of the currents sourced or sunk by all the I/Os (I/O ports and control pins) must always respect the absolute maximum ratings ΣI_{IO} .
2. Specified by design, not tested in production.
3. TTL and CMOS outputs are compatible with JEDEC standards JESD36 and JESD52.

Input/output AC characteristics

The definition and values of input/output AC characteristics are given in [Table 63](#).

Unless otherwise specified, the parameters given are derived from tests performed under the ambient temperature and supply voltage conditions summarized in [Table 20: General operating conditions](#).

Table 63. I/O AC characteristics⁽¹⁾⁽²⁾

Speed	Symbol	Parameter	Conditions	Min	Max	Unit
00	Fmax	Maximum frequency	$C=50 \text{ pF}$, $2.7 \text{ V} \leq V_{DD} \leq 3.6 \text{ V}$	-	5	MHz
			$C=50 \text{ pF}$, $2.0 \text{ V} \leq V_{DD} \leq 2.7 \text{ V}$	-	1	
			$C=10 \text{ pF}$, $2.7 \text{ V} \leq V_{DD} \leq 3.6 \text{ V}$	-	10	
			$C=10 \text{ pF}$, $2.0 \text{ V} \leq V_{DD} \leq 2.7 \text{ V}$	-	1.5	
	Tr/Tf	Output rise and fall time	$C=50 \text{ pF}$, $2.7 \text{ V} \leq V_{DD} \leq 3.6 \text{ V}$	-	25	ns
			$C=50 \text{ pF}$, $2.0 \text{ V} \leq V_{DD} \leq 2.7 \text{ V}$	-	52	
			$C=10 \text{ pF}$, $2.7 \text{ V} \leq V_{DD} \leq 3.6 \text{ V}$	-	17	
			$C=10 \text{ pF}$, $2.0 \text{ V} \leq V_{DD} \leq 2.7 \text{ V}$	-	37	

Table 63. I/O AC characteristics⁽¹⁾⁽²⁾ (continued)

Speed	Symbol	Parameter	Conditions	Min	Max	Unit
01	Fmax	Maximum frequency	C=50 pF, 2.7 V ≤ V _{DD} ≤ 3.6 V	-	25	MHz
			C=50 pF, 2.0 V ≤ V _{DD} ≤ 2.7 V	-	10	
			C=10 pF, 2.7 V ≤ V _{DD} ≤ 3.6 V	-	50	
			C=10 pF, 2.0 V ≤ V _{DD} ≤ 2.7 V	-	15	
	Tr/Tf	Output rise and fall time	C=50 pF, 2.7 V ≤ V _{DD} ≤ 3.6 V	-	9	ns
			C=50 pF, 2.0 V ≤ V _{DD} ≤ 2.7 V	-	16	
			C=10 pF, 2.7 V ≤ V _{DD} ≤ 3.6 V	-	4.5	
			C=10 pF, 2.0 V ≤ V _{DD} ≤ 2.7 V	-	9	
10	Fmax	Maximum frequency	C=50 pF, 2.7 V ≤ V _{DD} ≤ 3.6 V	-	50	MHz
			C=50 pF, 2.0 V ≤ V _{DD} ≤ 2.7 V	-	25	
			C=10 pF, 2.7 V ≤ V _{DD} ≤ 3.6 V	-	100 ⁽³⁾	
			C=10 pF, 2.0 V ≤ V _{DD} ≤ 2.7 V	-	37.5	
	Tr/Tf	Output rise and fall time	C=50 pF, 2.7 V ≤ V _{DD} ≤ 3.6 V	-	5.8	ns
			C=50 pF, 2.0 V ≤ V _{DD} ≤ 2.7 V	-	11	
			C=10 pF, 2.7 V ≤ V _{DD} ≤ 3.6 V	-	2.5	
			C=10 pF, 2.0 V ≤ V _{DD} ≤ 2.7 V	-	5	
11	Fmax	Maximum frequency	C=30 pF, 2.7 V ≤ V _{DD} ≤ 3.6 V	-	120 ⁽³⁾	MHz
			C=30 pF, 2.0 V ≤ V _{DD} ≤ 2.7 V	-	50	
			C=10 pF, 2.7 V ≤ V _{DD} ≤ 3.6 V	-	180 ⁽³⁾	
			C=10 pF, 2.0 V ≤ V _{DD} ≤ 2.7 V	-	75 ⁽³⁾	
	Tr/Tf	Output rise and fall time	C=30 pF, 2.7 V ≤ V _{DD} ≤ 3.6 V	-	3.3	ns
			C=30 pF, 2.0 V ≤ V _{DD} ≤ 2.7 V	-	6	
			C=10 pF, 2.7 V ≤ V _{DD} ≤ 3.6 V	-	1.7	
			C=10 pF, 2.0 V ≤ V _{DD} ≤ 2.7 V	-	3.3	

1. The maximum frequency is achieved with a duty cycle comprised between 45 and 55%, when loaded by the specified capacitance.

2. The fall and rise times are defined, respectively, between 90 and 10%, and between 10 and 90% of the output waveform.

3. This value represents the I/O capability but the maximum system frequency is limited to 64 MHz.

6.3.17 NRST pin characteristics

The NRST pin input driver uses the CMOS technology. It is connected to a permanent pull-up resistor, R_{PU}.

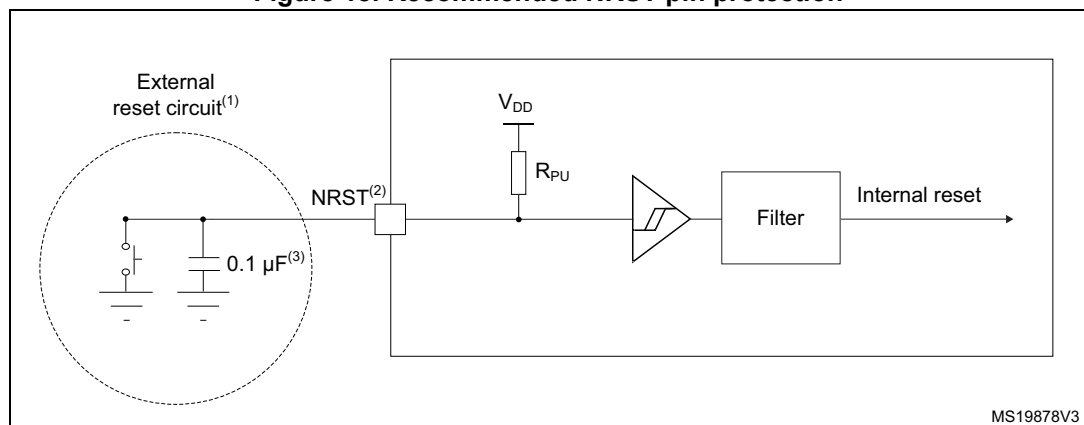

Unless otherwise specified, the parameters given in [Table 64](#) are derived from tests performed under the ambient temperature and supply voltage conditions summarized in [Table 20: General operating conditions](#).

Table 64. NRST pin characteristics⁽¹⁾

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NRST)}$	NRST input low level voltage	-	-	-	$0.3 \times V_{DD}$	V
$V_{IH(NRST)}$	NRST input high level voltage	-	$0.7 \times V_{DD}$	-	-	
$V_{hys(NRST)}$	NRST Schmitt trigger voltage hysteresis	-	-	200	-	mV
R_{PU}	Weak pull-up equivalent resistor ⁽²⁾	$V_{IN} = V_{SS}$	25	40	55	k Ω
$V_{F(NRST)}$	NRST input filtered pulse	-	-	-	70	ns
$V_{NF(NRST)}$	NRST input not filtered pulse	$2.0 \text{ V} \leq V_{DD} \leq 3.6 \text{ V}$	350	-	-	

1. Specified by design, not tested in production.
2. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance is minimal (~10%).

Figure 18. Recommended NRST pin protection

1. The reset network protects the device against parasitic resets.
2. The user must ensure that the level on the NRST pin can go below the $V_{IL(NRST)}$ max level specified in [Table 64](#), otherwise the reset will not be taken into account by the device.
3. The external capacitor on NRST must be placed as close as possible to the device.

6.3.18 Analog switches booster

Table 65. Analog switches booster characteristics⁽¹⁾

Symbol	Parameter	Min	Typ	Max	Unit
V_{DD}	Supply voltage	2.0	-	3.6	V
$t_{SU(BOOST)}$	Booster startup time	-	-	240	μs
$I_{DD(BOOST)}$	Booster consumption for $2.0\text{ V} \leq V_{DD} < 2.7\text{ V}$	-	-	500	μA
	Booster consumption for $2.7\text{ V} \leq V_{DD} \leq 3.6\text{ V}$	-	-	900	

1. Specified by design, not tested in production.

6.3.19 Analog-to-Digital converter characteristics

Unless otherwise specified, the parameters given in [Table 66](#) are preliminary values derived from tests performed under ambient temperature, f_{PCLK} frequency and V_{DDA} supply voltage conditions summarized in [Table 20: General operating conditions](#).

Note: It is recommended to perform a calibration after each power-up.

Table 66. ADC characteristics^{(1) (2)}

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{DDA}	Analog supply voltage	-	2.0	-	3.6	V
f_{ADC}	ADC clock frequency	-	0.14	-	35	MHz
f_s	Sampling rate	12 bits	-	-	2.50	Mpsps
		10 bits	-	-	2.92	
		8 bits	-	-	3.50	
		6 bits	-	-	4.38	
f_{TRIG}	External trigger frequency	$f_{ADC} = 35\text{ MHz}$ 12 bits	-	-	2.33	MHz
		12 bits	-	-	$f_{ADC} / 15$	
$V_{AIN}^{(3)}$	Conversion voltage range(2)	-	0	-	V_{DDA}	V
R_{AIN}	External input impedance	-	-	-	50	k Ω
C_{ADC}	Internal sample and hold capacitor	-	-	5	-	pF
t_{STAB}	Power-up time	-	2			Conversion cycle
t_{CAL}	Calibration time	$f_{ADC} = 35\text{ MHz}$	2.35			μs
		-	82			$1 / f_{ADC}$

Table 66. ADC characteristics^{(1) (2)} (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
t_{LATR}	Trigger conversion latency	CKMODE = 00	2	-	3	$1 / f_{ADC}$
		CKMODE = 01	-	6.5	-	
		CKMODE = 10	-	12.5	-	
		CKMODE = 11	-	3.5	-	
t_s	Sampling time	$f_{ADC} = 35 \text{ MHz}$	0.043	-	4.59	μs
		-	1.5	-	160.5	$1 / f_{ADC}$
$t_{ADCVREG_STUP}$	ADC voltage regulator start-up time	-	-	-	20	μs
t_{CONV}	Total conversion time (including sampling time)	$f_{ADC} = 35 \text{ MHz}$ Resolution = 12 bits	0.40	-	4.95	μs
		Resolution = 12 bits	$t_s + 12.5$ cycles for successive approximations = 14 to 173			$1 / f_{ADC}$
$I_{DDA(ADC)}$	ADC consumption from the V_{DDA} supply	$f_s = 2.5 \text{ Msps}$	-	475	-	μA
		$f_s = 1 \text{ Msps}$	-	190	-	
		$f_s = 10 \text{ ksps}$	-	17.3	-	

- Specified by design, not tested in production
- The I/O analog switch voltage booster is enabled when $V_{DDA} < 2.4 \text{ V}$ (BOOSTEN = 1 in the SYSCFG_CFGR1 when $V_{DDA} < 2.4 \text{ V}$). It is disable when $V_{DDA} \geq 2.4 \text{ V}$.
- V_{REF+} is internally connected to V_{DDA} and V_{REF-} is internally connected to V_{SS} .

Table 67. Maximum ADC R_{AIN} values

Resolution	Sampling cycle at 35 MHz (ns)	Sampling time at 35 MHz (ns)	Max. $R_{AIN}^{(1)(2)}(\Omega)$
12 bits	1.5	43	50
	3.5	100	680
	7.5	214	2200
	12.5	357	4700
	19.5	557	8200
	39.5	1129	15000
	79.5	2271	33000
	160.5	4586	50000

Table 67. Maximum ADC R_{AIN} values (continued)

Resolution	Sampling cycle at 35 MHz (ns)	Sampling time at 35 MHz (ns)	Max. $R_{AIN}^{(1)(2)}(\Omega)$
10 bits	1.5	43	68
	3.5	100	820
	7.5	214	3300
	12.5	357	5600
	19.5	557	10000
	39.5	1129	22000
	79.5	2271	39000
	160.5	4586	50000
8 bits	1.5	43	82
	3.5	100	1500
	7.5	214	3900
	12.5	357	6800
	19.5	557	12000
	39.5	1129	27000
	79.5	2271	50000
	160.5	4586	50000
6 bits	1.5	43	390
	3.5	100	2200
	7.5	214	5600
	12.5	357	10000
	19.5	557	15000
	39.5	1129	33000
	79.5	2271	50000
	160.5	4586	50000

1. Specified by design, not tested in production.

2. I/O analog switch voltage booster must be enabled (BOOSTEN = 1 in the SYSCFG_CFGR1) when $V_{DDA} < 2.4$ V and disabled when $V_{DDA} \geq 2.4$ V.

Table 68. ADC accuracy⁽¹⁾⁽²⁾⁽³⁾

Symbol	Parameter	Conditions ⁽⁴⁾	Min	Typ	Max	Unit
ET	Total unadjusted error	$V_{DDA} = 3\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = 25\text{ }^{\circ}\text{C}$	-	3	4	LSB
		$2.0\text{ V} < V_{DDA} < 3.6\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = \text{entire range}$	-	3	6.5	
EO	Offset error	$V_{DDA} = 3\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = 25\text{ }^{\circ}\text{C}$	-	1.5	2	
		$2.0\text{ V} < V_{DDA} < 3.6\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = \text{entire range}$	-	1.5	4.5	
EG	Gain error	$V_{DDA} = 3\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = 25\text{ }^{\circ}\text{C}$	-	3	3.5	
		$2.0\text{ V} < V_{DDA} < 3.6\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = \text{entire range}$	-	3	5	
ED	Differential linearity error	$V_{DDA} = 3\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = 25\text{ }^{\circ}\text{C}$	-	1.2	1.5	
		$2.0\text{ V} < V_{DDA} < 3.6\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = \text{entire range}$	-	1.2	1.5	
EL	Integral linearity error	$V_{DDA} = 3\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = 25\text{ }^{\circ}\text{C}$	-	2.5	3	
		$2.0\text{ V} < V_{DDA} < 3.6\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = \text{entire range}$	-	2.5	3	
ENOB	Effective number of bits	$V_{DDA} = 3\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = 25\text{ }^{\circ}\text{C}$	10.1	10.2	-	bit
		$2.0\text{ V} < V_{DDA} < 3.6\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = \text{entire range}$	9.6	10.2	-	
SINAD	Signal-to-noise and distortion ratio	$V_{DDA} = 3\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = 25\text{ }^{\circ}\text{C}$	62.5	63.0	-	dB
		$2.0\text{ V} < V_{DDA} < 3.6\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = \text{entire range}$	59.5	63.0	-	
SNR	Signal-to-noise ratio	$V_{DDA} = 3\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = 25\text{ }^{\circ}\text{C}$	63.0	64.0	-	
		$2.0\text{ V} < V_{DDA} < 3.6\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = \text{entire range}$	60.0	64.0	-	
THD	Total harmonic distortion	$V_{DDA} = 3\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = 25\text{ }^{\circ}\text{C}$	-	-74	-73	
		$2.0\text{ V} < V_{DDA} < 3.6\text{ V}$, $f_{ADC} = 35\text{ MHz}$, $f_s \leq 2.5\text{ Msps}$, $T_A = \text{entire range}$	-	-74	-70	

1. Based on characterization results, not tested in production.

2. ADC DC accuracy values are measured after internal calibration.

3. Injecting negative current on any analog input pin significantly reduces the accuracy of A-to-D conversion of signal on another analog input. It is recommended to add a Schottky diode (pin to ground) to analog pins susceptible to receive negative current.

4. I/O analog switch voltage booster is enabled (BOOSTEN = 1 in the SYSCFG_CFGR1) when $V_{DDA} < 2.4\text{ V}$ and disabled when $V_{DDA} \geq 2.4\text{ V}$.

Figure 19. ADC accuracy characteristics

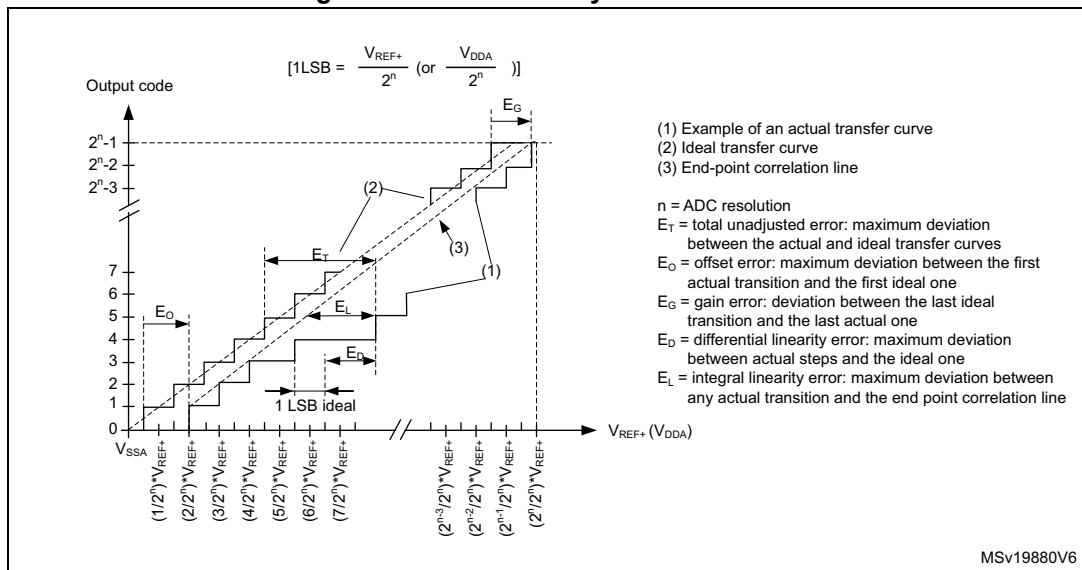

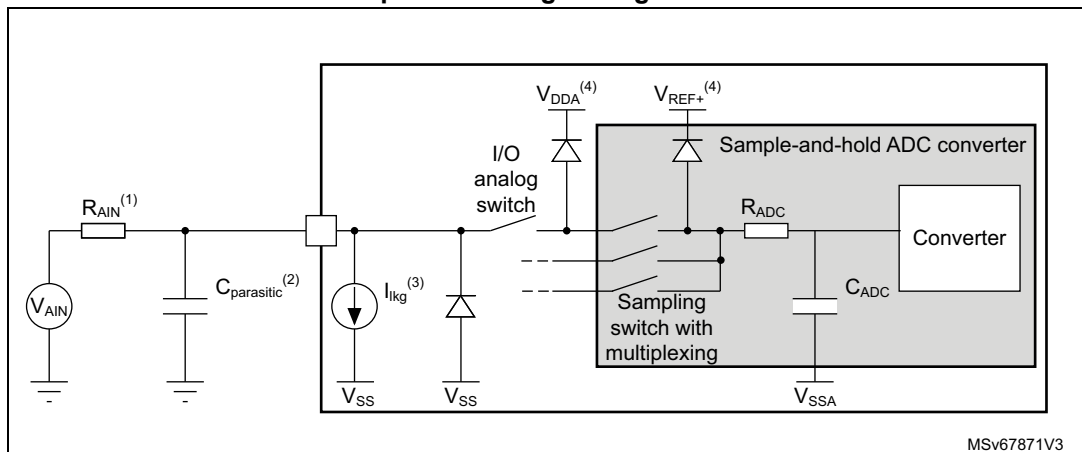

Figure 20. Typical connection diagram when using the ADC with FT/TT pins featuring analog switch function

1. Refer to [Table 66: ADC characteristics](#) for the values of R_{AIN} , R_{ADC} and C_{ADC} .
2. $C_{\text{parasitic}}$ represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (refer to [Table 61: I/O static characteristics](#) for the value of the pad capacitance). A high $C_{\text{parasitic}}$ value downgrades the conversion accuracy. To remedy this f_{ADC} must be reduced.
3. Refer to [Table 61: I/O static characteristics](#) for the values of I_{IKG} .
4. Refer to [Figure 10: Power supply scheme](#).

General PCB design guidelines

Power supply decoupling has to be performed as shown in [Figure 10: Power supply scheme](#). The 10 nF capacitor must be ceramic (good quality), placed as close as possible to the chip.

6.3.20 Temperature sensor characteristics

Table 69. TS characteristics

Symbol	Parameter	Min	Typ	Max	Unit
$T_L^{(1)}$	V_{TS} linearity with temperature	-	± 1	± 2	$^{\circ}\text{C}$
Avg_Slope ⁽²⁾	Average slope	2.3	2.5	2.7	mV / $^{\circ}\text{C}$
V_{30}	Voltage at 30 $^{\circ}\text{C}$ (± 5 $^{\circ}\text{C}$) ⁽³⁾	0.742	0.76	0.785	V
$t_{\text{START}}^{(1)}$ (TS_BUF) ⁽¹⁾	Sensor buffer start-up time in continuous mode ⁽⁴⁾	-	8	15	μs
$t_{\text{START}}^{(1)}$	Start-up time when entering in continuous mode ⁽⁴⁾	-	70	120	μs
$t_{\text{S_temp}}^{(1)}$	ADC sampling time when reading the temperature	5	-	-	μs
$I_{\text{DD}}(\text{TS})^{(1)}$	Temperature sensor consumption from V_{DD} , when selected by ADC	-	4.7	7	μA

1. Specified by design, not tested in production.
2. Evaluated by characterization, not tested in production.
3. Measured at $V_{\text{DDA}} = 3.0 \text{ V} \pm 10 \text{ mV}$. The V_{30} ADC conversion result is stored in the TS_CAL1 byte. Refer to [Table 9: Temperature sensor calibration values](#).
4. Continuous mode means Run/Sleep modes, or temperature sensor enable in Low-power run/Low-power sleep modes.

6.3.21 V_{BAT} monitoring characteristics

Table 70. V_{BAT} monitoring characteristics⁽¹⁾

Symbol	Parameter	Min	Typ	Max	Unit
R	Resistor bridge for V_{BAT}	-	3 x 39	-	k Ω
Q	Ratio on V_{BAT} measurement	-	3	-	-
$E_r^{(2)}$	Error on Q	-10	-	10	%
$t_{\text{S_vbat}}^{(2)}$	ADC sampling time when reading the VBAT	12	-	-	μs

1. $1.55 \text{ V} < V_{\text{BAT}} < 3.6 \text{ V}$.
2. Specified by design, not tested in production.

Table 71. V_{BAT} charging characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
R_{BC}	Battery charging resistor	VBRS = 0	-	5	-	k Ω
		VBRS = 1	-	1.5	-	

6.3.22 Timer characteristics

The parameters given in the following tables are Specified by design, not tested in production. Refer to [Section 6.3.16](#) for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

Table 72. TIMx⁽¹⁾ characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{res(TIM)}$	Timer resolution time	-	1	-	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 64 \text{ MHz}$	15.625	-	ns
f_{EXT}	Timer external clock frequency on CH1 to CH4	-	0	$f_{TIMxCLK} / 2$	MHz
		$f_{TIMxCLK} = 64 \text{ MHz}$	0	40	
Res_{TIM}	Timer resolution	TIM1	-	16	bit
		TIM2	-	32	
$t_{COUNTER}$	16-bit counter clock period	-	1	65536	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 64 \text{ MHz}$	0.015625	1024	μs
t_{MAX_COUNT}	Maximum possible count with 32-bit counter	-	-	65536×65536	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 64 \text{ MHz}$	-	67.10	s

1. TIMx is used as a general term, x stands for 1 or 2.

Table 73. IWDG min/max timeout period at 32 kHz (LSI)⁽¹⁾

Prescaler divider	PR[2:0] bits	Min timeout RL[11:0] = 0x000	Max timeout RL[11:0] = 0xFFFF	Unit
/4	0	0.125	512	ms
/8	1	0.250	1024	
/16	2	0.500	2048	
/32	3	1.0	4096	
/64	4	2.0	8192	
/128	5	4.0	16384	
/256	6 or 7	8.0	32768	

1. The exact timings still depend on the phasing of the APB interface clock vs. the LSI clock, hence there is always a full RC period of uncertainty.

6.3.23 Communication interfaces characteristics

I²C interface characteristics

The I2C interface meets the timings requirements of the I²C-bus specification and user manual rev. 03 for:

- Standard-mode (Sm): bit rate up to 100 kbit/s
- Fast-mode (Fm): bit rate up to 400 kbit/s
- Fast-mode Plus (Fm+): bit rate up to 1 Mbit/s.

Table 74. Minimum I2CCLK frequency in all I²C modes

Symbol	Parameter	Condition		Min	Unit
$f_{(I2CCLK)}$	I2CCLK frequency	Standard-mode	-	2	MHz
		Fast-mode	Analog filter ON, DNF = 0	8	
			Analog filter OFF, DNF = 1	9	
		Fast-mode Plus	Analog filter ON, DNF = 0	17	
			Analog filter OFF, DNF = 1	16	

The I2C timings requirements are Specified by design, not tested in production when the I2C peripheral is properly configured (refer to the reference manual RM0478).

The SDA and SCL I/O requirements are met with the following restriction: the SDA and SCL I/O pins are not “true” open-drain. When configured as open-drain, the PMOS connected between the I/O pin and V_{DD} is disabled, but is still present. The 20 mA output drive requirement in Fast-mode Plus is supported partially.

This limits the maximum load C_{load} supported in Fast-mode Plus, given by these formulas:

- $t_r(SDA/SCL) = 0.8473 \times R_p \times C_{load}$
- $R_p(min) = [V_{DD} - V_{OL(max)}] / I_{OL(max)}$

where R_p is the I2C lines pull-up. Refer to [Section 6.3.16](#) for the I2C I/Os characteristics.

All I2C SDA and SCL I/Os embed an analog filter, refer to [Table 75](#) for its characteristics.

Table 75. I2C analog filter characteristics⁽¹⁾

Symbol	Parameter	Min	Max	Unit
t_{AF}	Maximum pulse width of spikes that are suppressed by the analog filter	50 ⁽²⁾	100 ⁽³⁾	ns

1. Specified by design, not tested in production.
2. Spikes with widths below $t_{AF(min)}$ are filtered.
3. Spikes with widths above $t_{AF(max)}$ are not filtered

SPI characteristics

Unless otherwise specified, the parameters given in [Table 76](#) are derived from tests performed under the ambient temperature, f_{PCLKx} frequency and supply voltage conditions summarized in [Table 20: General operating conditions](#).

- Output speed is set to $OSPEEDRy[1:0] = 11$
- Capacitive load $C = 30$ pF
- Measurement points are done at CMOS levels: $0.5 \times V_{DD}$

Refer to [Section 6.3.16](#) for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI).

Table 76. SPI characteristics⁽¹⁾

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{SCK} $1/t_{c(SCK)}$	SPI clock frequency	Master mode $2.0 < V_{DD} < 3.6$ V	-	-	32	MHz
		Slave receiver mode $2.0 < V_{DD} < 3.6$ V	-	-	32	
		Slave mode transmitter/full duplex $2.7 < V_{DD} < 3.6$ V	-	-	32 ⁽²⁾	
		Slave mode transmitter/full duplex $2.0 < V_{DD} < 3.6$ V	-	-	24 ⁽²⁾	
$t_{su(NSS)}$	NSS setup time	Slave mode, SPI prescaler = 2	$4 \times T_{PCLK}$	-	-	-
$t_{h(NSS)}$	NSS hold time	Slave mode, SPI prescaler = 2	$2 \times T_{PCLK}$	-	-	
$t_{w(SCKH)}$ $t_{w(SCKL)}$	SCK high and low time	Master mode	$T_{PCLK} - 1.5$	T_{PCLK}	$T_{PCLK} + 1$	
$t_{su(MI)}$	Data input setup time	Master mode	6.5	-	-	ns
$t_{su(SI)}$		Slave mode	1.5	-	-	
$t_{h(MI)}$	Data input hold time	Master mode	4.5	-	-	
$t_{h(SI)}$		Slave mode	1.5	-	-	
$t_{a(SO)}$	Data output access time	Slave mode	9.0	-	34	
$t_{dis(SO)}$	Data output disable time		9.0	-	16	
$t_{v(SO)}$	Data output valid time	Slave mode $2.7 < V_{DD} < 3.6$ V	-	10.5	13.0	
		Slave mode $2.0 < V_{DD} < 3.6$ V	-	10.5	20.5	
$t_{v(MO)}$		Master mode (after enable edge)	-	2.5	3.0	
$t_{h(SO)}$	Data output hold time	Slave mode (after enable edge)	8.0	-	-	
$t_{h(MO)}$		Master mode (after enable edge)	1.0	-	-	

1. Evaluated by characterization, not tested in production.

2. Maximum frequency in Slave transmitter mode is determined by the sum of $t_{v(SO)}$ and $t_{su(MI)}$, which has to fit into SCK low or high phase preceding the SCK sampling edge. This value can be achieved when the SPI communicates with a master having $t_{su(MI)} = 0$ while Duty(SCK) = 50 %.

Figure 21. SPI timing diagram - Slave mode and CPHA = 0

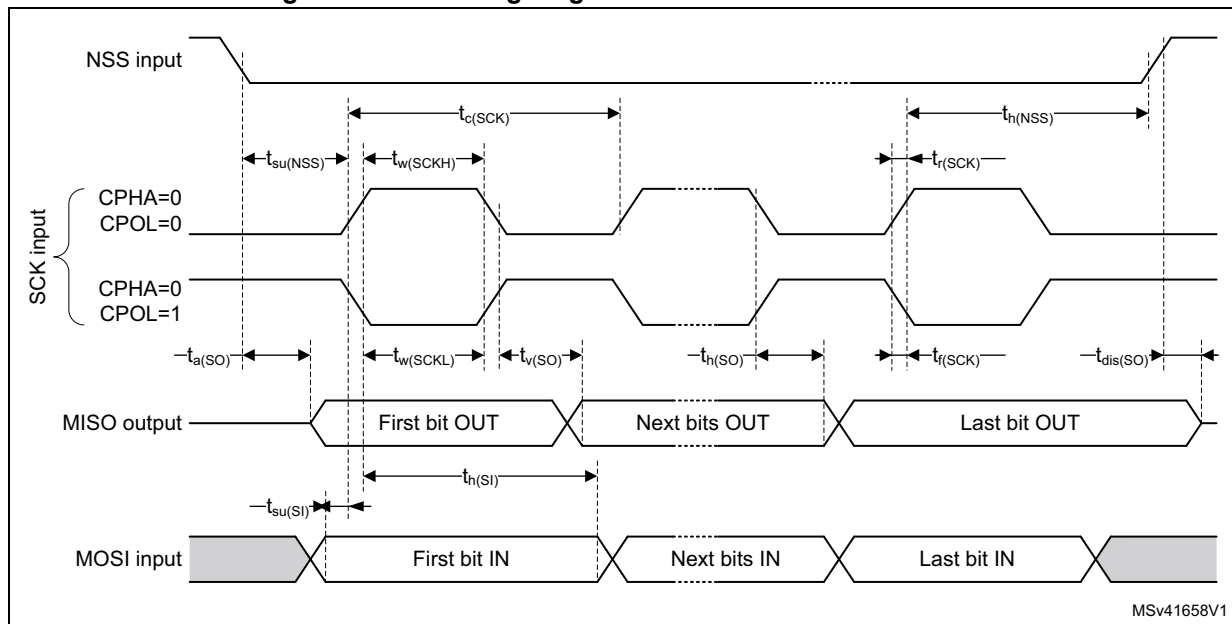

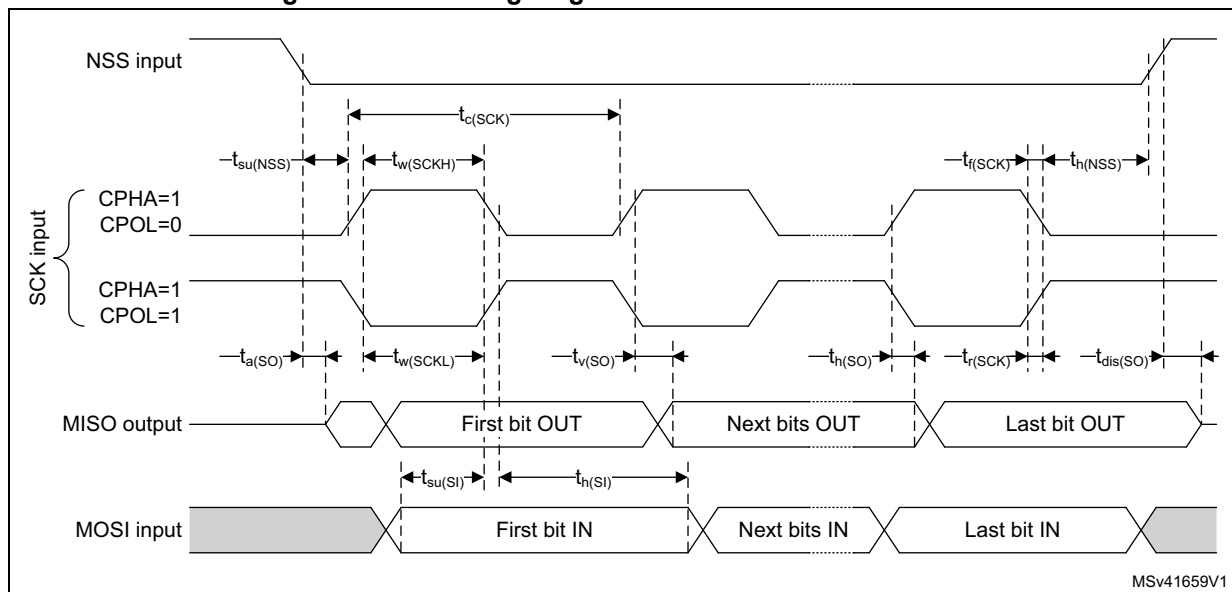

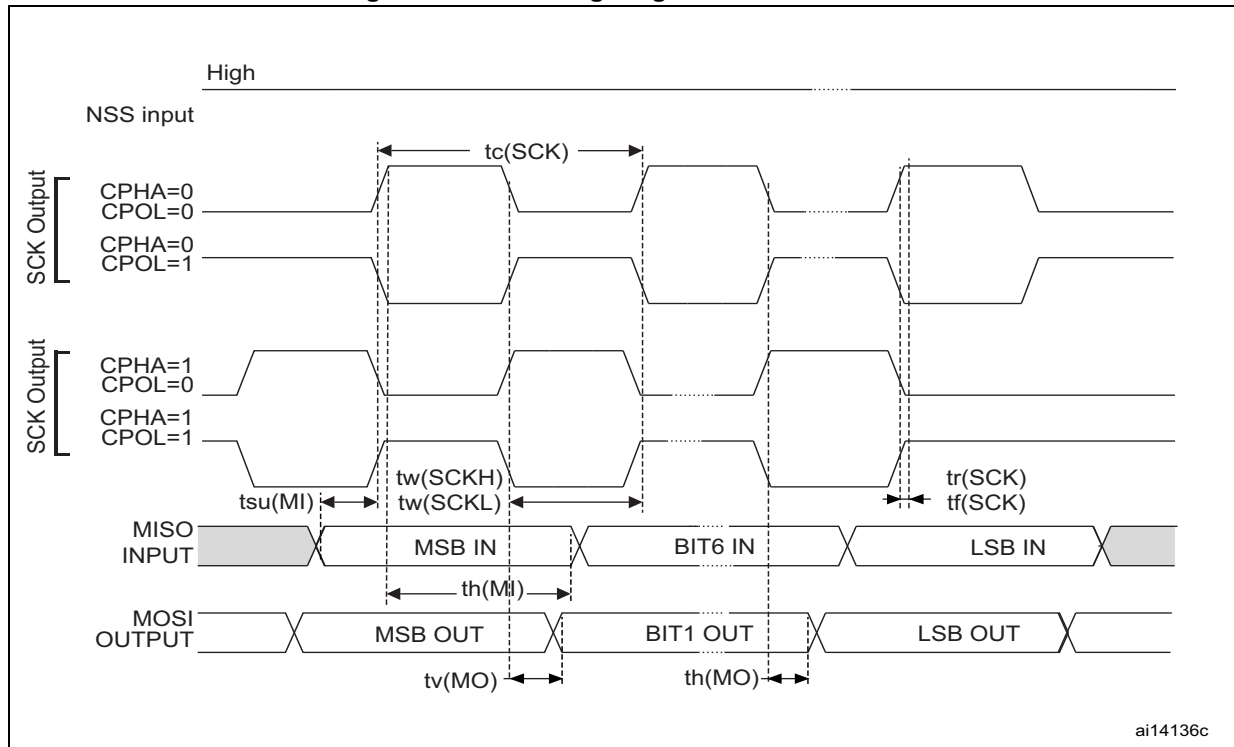

Figure 22. SPI timing diagram - Slave mode and CPHA = 1

1. Measurement points are set at CMOS levels: 0.3 V_{DD} and 0.7 V_{DD} .

Figure 23. SPI timing diagram - Master mode

1. Measurement points are set at CMOS levels: $0.3 V_{DD}$ and $0.7 V_{DD}$.

JTAG/SWD interface characteristics

Unless otherwise specified, the parameters given in [Table 77](#) and [Table 78](#) are derived from tests performed under the ambient temperature, f_{PCLKx} frequency and supply voltage conditions summarized in [Table 20: General operating conditions](#), with the following configuration:

- Capacitive load $C = 30$ pF
- Measurement points are done at CMOS levels: $0.5 \times V_{DD}$

Table 77. JTAG characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$1/t_{c(TCK)}$	TCK clock frequency	$2.7 < V_{DD} < 3.6$ V	-	-	29	MHz
		$2.0 < V_{DD} < 3.6$ V	-	-	21	
$t_{isu(TMS)}$	TMS input setup time	-	2.5	-	-	ns
$t_{ih(TMS)}$	TMS input hold time	-	2.0	-	-	
$t_{isu(TDI)}$	TDI input setup time	-	2.0	-	-	
$t_{ih(TDI)}$	TDI input hold time	-	2.0	-	-	
$t_{ov(TDO)}$	TDO output valid time	$2.7 < V_{DD} < 3.6$ V	-	13.5	16.5	
		$2.0 < V_{DD} < 3.6$ V	-	13.5	23.0	
$t_{oh(TDO)}$	TDO output hold time	-	11.0	-	-	

Table 78. SWD characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$1 / t_{c(SWCLK)}$	SWCLK clock frequency	$2.7 < V_{DD} < 3.6$ V	-	-	55	MHz
		$2.0 < V_{DD} < 3.6$ V	-	-	35	
$t_{isu(TMS)}$	SWDIO input setup time	-	2.5	-	-	ns
$t_{ih(TMS)}$	SWDIO input hold time	-	2.0	-	-	
$t_{ov(TDO)}$	SWDIO output valid time	$2.7 < V_{DD} < 3.6$ V	-	16	18	
		$2.0 < V_{DD} < 3.6$ V	-	16	28	
$t_{oh(TDO)}$	SWDIO output hold time	-	13	-	-	

Refer to [Section 6.3.16](#) for more details on the input/output alternate function characteristics (CK, SD, WS).

7 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.

7.1 Device marking

Refer to “*Reference device marking schematics for STM32 microcontrollers and microprocessors*” (TN1433) available on www.st.com, for the location of pin 1 / ball A1 as well as the location and orientation of the marking areas versus pin 1 / ball A1.

Parts marked as “ES”, “E” or accompanied by an engineering sample notification letter, are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST's Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

A WLCSP simplified marking example (if any) is provided in the corresponding package information subsection.

7.2 UFQFPN48 package information

UFQFPN48 is a 48-lead, 7 x 7 mm, 0.5 mm pitch, ultra thin fine pitch quad flat package.

Figure 24. UFQFPN48 outline

1. Drawing is not to scale.
2. All leads/pads should also be soldered to the PCB to improve the lead/pad solder joint life.
3. There is an exposed die pad on the underside of the UFQFPN package, it must be electrically connected to the PCB ground.

Table 79. UFQFPN48 mechanical data

Symbol	millimeters			inches ⁽¹⁾		
	Min	Typ	Max	Min	Typ	Max
A	0.500	0.550	0.600	0.0197	0.0217	0.0236
A1	0.000	0.020	0.050	0.0000	0.0008	0.0020
D	6.900	7.000	7.100	0.2717	0.2756	0.2795
E	6.900	7.000	7.100	0.2717	0.2756	0.2795
D2	5.500	5.600	5.700	0.2165	0.2205	0.2244
E2	5.500	5.600	5.700	0.2165	0.2205	0.2244
L	0.300	0.400	0.500	0.0118	0.0157	0.0197
T	-	0.152	-	-	0.0060	-
b	0.200	0.250	0.300	0.0079	0.0098	0.0118
e	-	0.500	-	-	0.0197	-
ddd	-	-	0.080	-	-	0.0031

1. Values in inches are converted from mm and rounded to four decimal digits.

Figure 25. UFQFPN48 recommended footprint

1. Dimensions are expressed in millimeters.

7.3 Thermal characteristics

The maximum chip junction temperature (T_{Jmax}) must never exceed the values given in [Table 24: General operating conditions](#).

The maximum chip-junction temperature, T_J max, in degrees Celsius, can be calculated using the equation:

$$T_J \text{ max} = T_A \text{ max} + (P_D \text{ max} \times \Theta_{JA})$$

where:

- T_A max is the maximum ambient temperature in °C,
- Θ_{JA} is the package junction-to-ambient thermal resistance, in °C / W,
- P_D max is the sum of P_{INT} max and $P_{I/O}$ max ($P_D \text{ max} = P_{INT} \text{ max} + P_{I/O} \text{ max}$),
- P_{INT} max is the product of I_{DD} and V_{DD} , expressed in Watt. This is the maximum chip internal power.

$P_{I/O}$ max represents the maximum power dissipation on output pins:

$$P_{I/O} \text{ max} = \sum (V_{OL} \times I_{OL}) + \sum ((V_{DD} - V_{OH}) \times I_{OH})$$

taking into account the actual V_{OL} / I_{OL} and V_{OH} / I_{OH} of the I/Os at low and high level in the application.

Note: As the radiated RF power is quite low (< 4 mW), it is not necessary to remove it from the chip power consumption.

Table 80. Package thermal characteristics

Symbol	Parameter	Value	Unit
Θ_{JA}	Thermal resistance junction-ambient UFQFPN48 - 7 mm x 7 mm	27.7	°C / W
Θ_{JB}	Thermal resistance junction-board UFQFPN48 - 7 mm x 7 mm	12.0	
Θ_{JC}	Thermal resistance junction-case UFQFPN48 - 7 mm x 7 mm	1.6	

7.3.1 Reference document

JESD51-2 Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air). Available from www.jedec.org

7.3.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the information scheme shown in [Section 8](#).

Each temperature range suffix corresponds to a specific guaranteed ambient temperature at maximum dissipation and to a specific maximum junction temperature.

As applications do not commonly use the device at maximum dissipation, it is useful to calculate the exact power consumption and junction temperature to determine the temperature range that best suits the application.

The following example show how to calculate the temperature range needed for a given application.

Example: High-performance application

Assuming the following application conditions:

Maximum ambient temperature $T_A \text{ max} = 82\text{ }^{\circ}\text{C}$ (measured according to JESD51-2),
 $I_{DD} \text{ max} = 50\text{ mA}$, $V_{DD} = 3.5\text{ V}$, maximum 20 I/Os used at the same time in output at
low level with $I_{OL} = 8\text{ mA}$, $V_{OL} = 0.4\text{ V}$ and maximum 8 I/Os used at the same time in
output at low level with $I_{OL} = 20\text{ mA}$, $V_{OL} = 1.3\text{ V}$

$$P_{INT} \text{ max} = 50\text{ mA} \times 3.5\text{ V} = 175\text{ mW}$$

$$P_{IO} \text{ max} = 20 \times 8\text{ mA} \times 0.4\text{ V} + 8 \times 20\text{ mA} \times 1.3\text{ V} = 272\text{ mW}$$

This gives: $P_{INT} \text{ max} = 175\text{ mW}$ and $P_{IO} \text{ max} = 272\text{ mW}$

$$P_D \text{ max} = 175 + 272 = 447\text{ mW}$$

Using the values obtained in [Table 80](#) $T_J \text{ max}$ is calculated as follows:

– For UFQFPN48, $27.7\text{ }^{\circ}\text{C} / \text{W}$

$$T_J \text{ max} = 82\text{ }^{\circ}\text{C} + (27.7\text{ }^{\circ}\text{C} / \text{W} \times 447\text{ mW}) = 82\text{ }^{\circ}\text{C} + 12\text{ }^{\circ}\text{C} = 94\text{ }^{\circ}\text{C}$$

This is within the range of the suffix 5 version parts ($-10 < T_J < 105\text{ }^{\circ}\text{C}$), see [Section 8](#).

8 Ordering information

Example:	STM32	WB	10	C	C	U	5	TR
Device family								
STM32 = Arm® based 32-bit microcontroller								
Product type								
WB = Wireless Bluetooth®								
Device subfamily								
10 = Die 1, full set of features								
Pin count								
C = 48 pins								
Flash memory size								
C = 320 Kbytes								
Package								
U = UFQFPN48 7 x 7 mm								
Temperature range								
5 = Industrial temperature range, -10 to 85 °C (105 °C junction)								
Packing								
TR = tape and reel								
xxx = programmed parts								

For a list of available options (such as speed or package), or for further information on any aspect of this device, contact the nearest ST sales office.

9 Important security notice

The STMicroelectronics group of companies (ST) places a high value on product security, which is why the ST product(s) identified in this documentation may be certified by various security certification bodies and/or may implement our own security measures as set forth herein. However, no level of security certification and/or built-in security measures can guarantee that ST products are resistant to all forms of attacks. As such, it is the responsibility of each of ST's customers to determine if the level of security provided in an ST product meets the customer needs both in relation to the ST product alone, as well as when combined with other components and/or software for the customer end product or application. In particular, take note that:

- ST products may have been certified by one or more security certification bodies, such as Platform Security Architecture (www.psacertified.org) and/or Security Evaluation standard for IoT Platforms (www.trustcb.com). For details concerning whether the ST product(s) referenced herein have received security certification along with the level and current status of such certification, either visit the relevant certification standards website or go to the relevant product page on www.st.com for the most up to date information. As the status and/or level of security certification for an ST product can change from time to time, customers should re-check security certification status/level as needed. If an ST product is not shown to be certified under a particular security standard, customers should not assume it is certified.
- Certification bodies have the right to evaluate, grant and revoke security certification in relation to ST products. These certification bodies are therefore independently responsible for granting or revoking security certification for an ST product, and ST does not take any responsibility for mistakes, evaluations, assessments, testing, or other activity carried out by the certification body with respect to any ST product.
- Industry-based cryptographic algorithms (such as AES, DES, or MD5) and other open standard technologies which may be used in conjunction with an ST product are based on standards which were not developed by ST. ST does not take responsibility for any flaws in such cryptographic algorithms or open technologies or for any methods which have been or may be developed to bypass, decrypt or crack such algorithms or technologies.
- While robust security testing may be done, no level of certification can absolutely guarantee protections against all attacks, including, for example, against advanced attacks which have not been tested for, against new or unidentified forms of attack, or against any form of attack when using an ST product outside of its specification or intended use, or in conjunction with other components or software which are used by customer to create their end product or application. ST is not responsible for resistance against such attacks. As such, regardless of the incorporated security features and/or any information or support that may be provided by ST, each customer is solely responsible for determining if the level of attacks tested for meets their needs, both in relation to the ST product alone and when incorporated into a customer end product or application.
- All security features of ST products (inclusive of any hardware, software, documentation, and the like), including but not limited to any enhanced security features added by ST, are provided on an "AS IS" BASIS. AS SUCH, TO THE EXTENT PERMITTED BY APPLICABLE LAW, ST DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, unless the applicable written and signed contract terms specifically provide otherwise.
