2ED2304S06F

2ED2304S06F

650 V Half Bridge Gate Driver with Integrated Bootstrap Diode (BSD)

Features

- Infineon thin-film-SOI-technology
- Fully operational to +650 V
- Floating channel designed for bootstrap operation
- Output source/sink current capability +0.36 A/-0.7 A
- Integrated Ultra-fast, low *R*_{DS(ON)} Bootstrap Diode
- Tolerant to negative transient voltage up to -100 V (Pulse width is up 300 ns) given by SOI-technology
- 10 ns typ., 60 ns max. propagation delay matching
- dV/dt immune ±50 V
- Gate drive supply range from 10 V to 20 V
- Undervoltage lockout for both channels
- Integrated dead-time with interlocking function
- 3.3 V, 5 V and 15 V input logic compatible
- RoHS compliant

Potential applications

- Motor drives, General purpose inverters
- Refrigeration compressors
- Half-bridge and full-bridge converters in offline AC-DC power supplies for telecom and lighting

Product validation

Qualified for industrial applications according to the relevant tests of JEDEC47/20/22.

Description

The 2ED2304S06F is a 650-V half-bridge gate driver. Its Infineon thin-film-SOI technology provides excellent ruggedness and noise immunity. The Schmitt trigger logic inputs are compatible with standard CMOS or LSTTL logic down to 3.3 V. The output drivers feature a high pulse current buffer stage designed for minimum driver cross-conduction with built in interlock lock logic to prevent shoot-through. The floating channel can be used to drive an N-channel power MOSFET or IGBT in the high side configuration which operates up to 650 V.

3 Electrical parameters

3.1 Absolute maximum ratings

Absolute maximum ratings indicate sustained limits beyond which damage to the device may occur. All voltage parameters are absolute voltages referenced to COM unless otherwise stated in the table. The thermal resistance and power dissipation ratings are measured under board mounted and still air conditions.

Symbol	Definition	Min.	Max.	Units
-	High-side floating well supply voltage ¹	V _{cc} – 6	670	
V_{B}	High-side floating well supply voltage (tp < 300 ns) ¹	V _{cc} - 100	_	
N/	High-side floating well supply return voltage	$V_{CC} - V_{BS} - 6$	650	
Vs	High-side floating well supply return voltage (tp < 300 ns) ¹	V _{CC} -V _{BS} - 100	_	
V _{HO}	Floating gate drive output voltage	Vs-0.5	V _B +0.5	V
V_{BS}	Floating gate drive voltage supply voltage	-1	20	
Vcc	Low side supply voltage	-1	20	
V_{LO}			V _{cc} + 0.5	
V_{IN}	Logic input voltage	-0.5	V _{cc} + 0.5	
dVs/dt	Allowable V_{S} offset supply transient relative to GND^2	_	50	V/ns
PD	Package power dissipation @ $T_A \leq +25 ^{\circ}C$	—	0.6	W
Rth _{JA}	Thermal resistance, junction to ambient	—	195	°C/W
TJ	Junction temperature – 150			
Ts			150	°C
ΤL	Lead temperature (soldering, 10 seconds)	—	300	

Table 2 Absolute maximum ratings

3.2 Recommended operating conditions

For proper operation, the device should be used within the recommended conditions. All voltage parameters are absolute voltages referenced to COM unless otherwise stated in the table. The offset rating is tested with supplies of ($V_{cc} - COM$) = ($V_B - V_S$) = 15 V.

Table 3 Recommended operating conditions

Symbol	Definition	Min	Мах	Units
VB	High-side floating well supply voltage	Vs+10	Vs+17.5	
Vs	High-side floating well supply offset voltage ³	$V_{CC} - V_{BS} - 1$	650	
V_{HO}	Floating gate drive output voltage	10	V _{BS}	
V_{BS}	High-side supply voltage	10	17.5	V
Vcc	Low-side supply voltage	10	17.5	
V_{LO}	Low-side output voltage	0	V _{cc}	
V _{IN}	Logic input voltage⁴	0	Vcc	
T _A	Ambient temperature	-40	125	°C
t _{IN}	Pulse width for ON and OFF⁵	0.3	—	μs

 $^{^{1}}$ In case V_{CC} > V_B there is an additional power dissipation in the internal bootstrap diode between pins V_{CC} and V_B in case of activated bootstrap diode. Insensivity to negative transient not subject to production test. Verified by design/characterization.

² Not subject to production test, verified by characterization.

 $^{^3}$ Logic operation for Vs of -8 V to +600 V.

⁴ All input pins (HIN, LIN) are internally clamped

 $^{^{\}rm 5}$ Input pulses may not be transmitted properly in case of LIN/HIN below 0.3 μs

3.3 Static electrical characteristics

 $(V_{CC} - COM) = (V_B - V_S) = 15 V$, and $T_A = 25^{\circ}C$ unless otherwise specified. The V_{IL} , V_{IH} and I_{IN} parameters are referenced to GND and are applicable to the respective input leads: HIN and LIN. The V_0 and I_0 parameters are referenced to COM/VS and are applicable to the respective output leads HO or LO. The V_{CCUV} parameters are referenced to COM. The V_{BSUV} parameters are referenced to V_S.

	Static Electrical characteristics					
Symbol	Definition	Min.	Тур.	Max.	Units	Test Conditions
V_{BSUV^+}	V _{BS} supply undervoltage positive going threshold	8.3	9.1	9.9

3.4 Dynamic electrical characteristics

 V_{CC} = V_{BS} = 15 V, V_{SS} = COM, T_A = 25°C and C_L = 1000 pF unless otherwise specified.

 Table 5
 Dynamic electrical characteristics

Symbol	Definition	Min.	Тур.	Max.	Units	Test Conditions
ton	Turn-on propagation delay	210	310	460		V = 0 or 2.2 V
t_{OFF}	Turn-off propagation delay	200	300	440		$V_{\rm LIN/HIN}$ = 0 or 3.3 V
t _R	Turn-on rise time	-	48	80		$V_{\text{LIN/HIN}} = 0 \text{ or } 3.3 \text{ V}$
t⊧	Turn-off fall time		24	40	ns	C _L = 1 nF
t _{FILIN}	Input filter time	100	150	250	115	$V_{\rm LIN/HIN}$ = 0 & 3.3 V
МТ	Delay matching time (HS & LS turn-on/off)	_	10	60		external dead time > 500 ns
DT	Dead time	30	75	140		$V_{\rm LIN/HIN}$ = 0 & 3.3 V
MDT	Dead time matching time	_	10	50		ext. dead time 0 ns

4 Input/output logic diagram

The relationships between the input and output signals of the 2ED2304S06F is illustrated below in Figure 4. Note that the input stage has integrated interlock logic to prevent shoot-through operation of the outputs.

5 Tolerant to negative transient voltage on VS pin (-VS)

A common problem in today's high-power switching converters is the transient response of the switch node's voltage as the power switches transition on and off quickly while carrying a large current. A typical three phase inverter circuit is shown in Figure 5; here we define the power switches and diodes of the inverter.

If the high-side switch (e.g., the IGBT Q1 in Figure 6 and Figure 7) switches off, while the U phase current is flowing to an inductive load, a current commutation occurs from high-side switch (Q1) to the diode (D2) in parallel with the low-side switch of the same inverter leg. At the same instance, the voltage node V_{S1}, swings from the positive DC bus voltage to the negative DC bus voltage.

Also when the V phase current flows from the inductive load back to the inverter (see Figure 8 and Figure 9), and Q4 IGBT switches on, the current commutation occurs from D3 to Q4. At the same instance, the voltage node, V_{s2}, swings from the positive DC bus voltage to the negative DC bus voltage.

Figure 8 D3 conducting

Figure 9 Q4 conducting

However, in a real inverter circuit the V_s voltage swing does not stop at the level of the negative DC bus but instead swings below the level of the negative DC bus. This undershoot voltage is called "negative transient voltage".

The circuit shown in Figure 10 depicts one leg of the three phase inverter; Figure 11 and Figure 12 show a simplified illustration of the commutation of the current between Q1 and D2. The parasitic inductances in the power circuit from the die bonding to the PCB tracks are lumped together in L_c and L_E for each IGBT. When the high-side switch is on, V_{S1} is below the DC+ voltage by the voltage drops associated with the power switch and the parasitic elements of the circuit. When the high-side power switch turns off, the load current momentarily flows in the low-side freewheeling diode due to the inductive load connected to V_{S1} (the load is not shown in these figures). This current flows from the DC- bus (which is connected to the COM pin of the HVIC) to the load and a negative voltage between V_{S1} and the DC- Bus is induced (i.e., the COM pin of the HVIC is at a higher potential than the VS pin).

In a typical motor drive system, dV/dt is typically designed to be in the range of 3-5 V/ns. The negative transient voltage can exceed this range during some events such as short circuit and over-current shutdown, when di/dt is greater than in normal operation.

Infineon's HVICs have been designed for the robustness required in many of today's demanding applications. An indication of the 2ED2304S06F's robustness can be seen in Figure 13, where the 2ED2304S06F Safe Operating Area is shown at V_{BS} =15 V based on repetitive negative transient voltage spikes. A negative transient voltage falling in the grey area (outside SOA) may lead to IC permanent damage; viceversa unwanted functional anomalies or permanent damage to the IC do not appear if negative VS transients fall inside the SOA.

Figure 13 Negative transient voltage SOA on VS pin for 2ED2304S06F @ VBS=15 V

Even though the 2ED2304S06F has been shown to be able to handle these large negative transient voltage conditions, it is highly recommended that the circuit designer always limit the negative transient voltage on VS pin as much as possible by careful PCB layout and component use.
