I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor Rev. 1.2 — 15 July 2024

Product data sheet

General description 1

The P3T1035xUK/P3T2030xUK is a temperature-to-digital converter from -40 °C to +125 °C range. It uses an on-chip band gap temperature sensor and A-to-D conversion technique with an overtemperature detection. The device contains a number of data registers: Configuration (Conf) stores the device settings such as device operation mode, and temperature register (Temp) stores the digital temp reading, which communicates by a controller via the 2-wire serial I3C/I²C-bus interface.

The P3T1035xUK/P3T2030xUK can be configured for different operation conditions. It can be set in normal mode to monitor periodically the ambient temperature, or in shutdown mode to minimize power consumption. The temperature register always stores a 12-bit two's complement data (2 Bytes), giving a temperature resolution of 0.0625 °C. It also allows 8-bit (MSByte) reading with temperature resolution of 1 °C.

In I²C mode, the P3T1035xUK/P3T2030xUK supports global read/write operations that allow the controller to access multiple devices simultaneously. It does not require the controller to access each P3T1035xUK/ P3T2030xUK individually.

The P3T1035xUK offers the accuracy ± 0.5 °C from 0 °C to ± 70 °C at V_{CC} ≥ 1.62 V.

The P3T2030xUK offers the accuracy ±2 °C from -40 °C to +125 °C at $V_{CC} \ge$ 1.62 V.

See detailed description of accuracy vs temperature and V_{CC} range in Section 2 and Table 27.

The P3T1035xUK/P3T2030xUK is available in WLCSP4 package and has 8 factory-programmed device address options.

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

2 Features and benefits

- I3C and I²C interface
- Supply range: 1.4 V to 1.98 V
- Eight different device addresses (A through H) are available
- Programmable undertemperature and overtemperature registers
- Resolution: 12 bits (0.0625 °C); supports 8-bit reading
- Accuracy: P3T1035xUK
- $-1.62 \text{ V} \le \text{V}_{\text{CC}} \le 1.98 \text{ V}$
 - ±0.5 °C (maximum) from 0 °C to +70 °C
 - ±1 °C (maximum) from -40 °C to +125 °C
- 1.4 V ≤ V_{CC} < 1.62 V
 - ±2 °C (maximum) from -20 °C to +100 °C
 - ±3 °C (maximum) from -40 °C to +125 °C
- Accuracy: P3T2030xUK
- $1.62 \text{ V} \le \text{V}_{\text{CC}} \le 1.98 \text{ V}$
 - ±2 °C (maximum) from -40 °C to +125 °C
- 1.4 V \leq V_{CC} < 1.62 V
 - _±2 °C (maximum) from -20 °C to +100 °C
 - ±3 °C (maximum) from -40 °C to +125 °C
- Low quiescent current: 6 µA supply current (typical).
- Package: wafer level chip-scale package, 4 terminals, 0.4 mm pitch, 0.91 mm x 0.855 mm x 0.455 mm body

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

3 Applications

- Portable devices
- IoT
- SSD
- Industrial controllers
- Servers
- PC/notebook

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

7 Functional description

7.1 General operation

The P3T1035xUK/P3T2030xUK uses the on-chip bandgap sensor to measure the device temperature with the resolution of 0.0625 °C and stores the 12-bit two's complement digital data, from 12-bit A-to-D conversion, into the device Temp register (2 Bytes). It also allows 8-bit (MSByte) temperature reading. This Temp register can be read at any time by a controller on the I3C/I²C-bus. The temperature range is from -40 °C to 125 °C.

The P3T1035xUK/P3T2030xUK can be set to operate in three modes: one-shot, continuous conversion, or shutdown mode through mode bits M1 and M0. That allows the user flexibility for different mode operations.

7.2 I²C-bus serial interface

The device can be connected to a compatible 2-wire serial interface Fast-mode Plus I²C-bus as a target device under the control of a controller device, using two device terminals, SCL, and SDA. The controller must provide the SCL clock signal and write/read data to/from the device through the SDA terminal. Notice that if the I²C-bus common pull-up resistors have not been installed as required for I²C-bus, then an external pull-up resistor, about 5 k Ω , is needed for each of these two terminals. The bus communication protocols are described in Section 7.7.

7.3 I²C target and mode description

7.3.1 I²C target address

To communicate with the device, the controller must first address target devices via a target address byte. The device features eight different part numbers to allow up to eight devices. See <u>Section 7.3.1</u> for part number vs addresses.

No.	Part Number	Target address	
1	P3T1035AUK or P3T2030AUK	1110 000	
2	P3T1035BUK or P3T2030BUK	1110 001	
3	P3T1035CUK or P3T2030CUK	1110 010	
4	P3T1035DUK or P3T2030DUK	1110 011	
5	P3T1035EUK or P3T2030EUK	1110 100	
6	P3T1035FUK or P3T2030FUK	1110 101	
7	P3T1035GUK or P3T2030GUK	1110 110	
8	P3T1035HUK or P3T2030HUK	1110 111	

Table 5. P3T1035xUK/P3T2030xUK part number vs. address table (WLCSP – 4 Balls)

7.3.2 General Call

The general call address is (0000000) if the eighth bit is 0. The device will acknowledge the general call and responds to commands in the second byte. If the second byte is 00000110, the device internal registers are reset to power-up values.

P3T1035XUK_P3T2030XUK Product data sheet

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

7.3.3 High-Speed (Hs) Mode

The controller device must send an SMBus Hs-mode controller code (00001xxx) as the first byte after a start condition to enable the bus to high-speed operation. After receiving the Hs-mode code, P3T1035xUK/ P3T2030xUK allows up to 3.4 MHz SMBus speed.

7.3.4 Timeout function

If the SCL or SDA lines are held LOW for longer than t_{to} (15 ms minimum; guaranteed at 45 ms maximum), the device resets to the idle state (SDA released) and waits for a new START condition. This ensures that the device never hangs up the bus if there are conflicts in the transmission sequence.

7.3.5 Multiple Device Access (for l²C only)

The P3T1035xUK/P3T2030xUK have a feature called Multiple Device Access (MDA). It allows the controller to communicate with multiple P3T1035xUK/P3T2030xUK devices with one interface transaction on the same I²C-bus. MDA commands contain an MDA read address (00000001) and an MDA write address (00000000). The P3T1035xUK/P3T2030xUK devices acknowledge the MDA address and respond to the command. For MDA to work correctly, different product I²C device addresses of the P3T1035xUK/P3T2030xUK must be used in the system; see Table 5.

The MDA function is a special function which is not defined by I²C or I3C standards. The MDA only supports one-byte read/write when the P3T1035xUK/P3T2030xUK is working at I²C. When P3T1035xUK/P3T2030xUK is working at I3C, it doesn't have the MDA function.

7.3.5.1 Multiple device access write

The controller sends an MDA write address after the pointer address of the register to be accessed; see <u>Table 16</u>. All of the P3T1035xUK/P3T2030xUK devices on the bus acknowledge and wait for the next data byte to be written to the addressed registers by following the pointer. When the data byte is received by the P3T1035xUK/P3T2030xUK devices, they store and acknowledge the transmitted byte. In on transaction, the P3T1035xUK/P3T2030xUK devices store the same data on all devices on the l²C-bus. See <u>Figure 22</u>.

7.3.5.2 Multiple device access read

To perform an MDA read transaction, the controller must send an MDA write transaction first to set the associated pointer address of the register to be accessed (see <u>Section 7.3.5.1</u>). Then the controller can send an MDA read address followed by a read byte for each P3T1035xUK/P3T2030xUK on the I²C-bus. For example, if a P3T2030A and P3T2030B are used on the same bus and an MDA read address is sent, the address must be followed by two bytes of data and two controller acknowledges. The first byte data is sent by P3T2030A and the second byte data is sent by P3T2030B. The controller must issue an acknowledge for each byte read to read all of the P3T2030xUK devices on the bus; see Figure 23. If there is no acknowledge each byte of data from the controller, the P3T1035xUK/P3T2030xUK stop sending data for any remaining devices.

In the MDA transaction, the P3T1035xUK/P3T2030xUK only supports one byte (MSByte) read and write for the Temp, t_{HIGH} and t_{LOW} registers. The LSByte cannot be accessed during MDA.

Up to eight P3T1035xUK/P3T2030xUK devices can respond to MDA commands on the same I²C-bus. See <u>Table 5</u>.

7.4 I3C-bus serial interface

The P3T1035xUK/P3T2030xUK interface includes a MIPI I3C SDR only target interface. The I3C controller can assign a dynamic address to P3T1035xUK/P3T2030xUK by issuing a SETDASA (Set Dynamic Address from Static Address) CCC command.

Product		

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

7.4.1 Dynamic address assignment flow

See Figure 3 for the dynamic address assignment flow

7.4.2 I3C provisional-ID

The I3C provisional-ID field is a 6-byte read-only (48 bits) word giving the following information:

- 15 bits with the manufacturer name, unique per manufacturer (for example, NXP).
- 1 bit indicating whether the device has a random ID or a structured provisional-ID
- 16 bits with the device identification, assigned by manufacturer.
- 4 bits providing the device instantiation information.

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

• 12 bits with the device revision, assigned by manufacturer.

The exact Mipi-I3C provisional-ID composition format in <u>Table 6</u> and provisional-ID vs. P3T2030xUK full part number in <u>Table 7</u>.

Table 6. I3C Provisional-ID composition

Manufacturer ID	Non-Random part number	Device ID	Instance ID	Version

8	P3T1035HUK or P3T2030HUK	1110 111	0000 1110 1110

[1] I²C address 1110 110 doesn't support I3C SETDASA (Set Dynamic Address from Static Address) due to it being one of the I3C target restricted addresses.

7.4.3 BCR and DCR

The I3C devices have a read-only Bus Characterization Register (BCR) and a Device Characterization Register (DCR). These can be read using the GETCBCR and GETDCR CCC.

The BCR contains information describing the device's role and capabilities related to the I3C bus. The content of the P3T2108UK is listed in <u>Table 8</u>.

 Table 8. Bus Characterization Register (BCR)

Bit	Function	Description
BCR[7]	Device role	2'b00: I3C target
BCR[6]		
BCR[5]	Advanced Capabilities	0: Does not support optional advanced capabilities
BCR[4]	Virtual Target Support	0: Is not a Virtual Target and does not expose other downstream Device(s)
BCR[3]	Offline capable	0: device will always react to I3C-bus commands
BCR[2]	IBI Payload	0: No data bytes follow the accepted IBI
BCR[1]	IBI Request capable	1: capable
BCR[0]	Maximum data speed limitation	1: Limitation

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

The DCR describes the device type for the bus controller to assess and assign the dynamic address and use common command codes as listed in <u>Table 9</u>

Table 9. Device Characterization Register (DCR)

Bit [7:0]	Description
0110 0011	Temperature sensor

7.4.4 I3C Common Command Codes (CCC)

MIPI I3C devices listen to and support a number of the Common Command Codes (CCC) to control certain features and behaviors e.g. reset the device, enabled/disable in-band interrupts or renew the device dynamic address.

P3T2108UK supports CCCs that allow the controller to control multiple targets through a broadcast command at once or individual targets through direct commands are listed in <u>Table 10</u>.

Common CCC type **Command Name** Default Description Command setting Code 0x00 Broadcast ENEC[1] Enable Events Enabled Enable Target event driven interrupts Command 0x06 RSTDAA[1] Reset Dynamic Forget current Dynamic Address and wait for Broadcast Address Assignment new assignment 0x07 ENTDAA[1] Enter Dynamic Entering Controller initiation of Target Broadcast Address Assignment Dynamic Address Assignment. Don't participate if the Target already has an Address assigned. 0x80 Direct ENEC[1] Enable Events enabled Enable Target event driven interrupts Command DISEC[1] Disable Events 0x81 Direct disabled Disable Target event driven interrupts Command Direct Set SETDASA[1] Set Dynamic Controller assigns a Dynamic Address to a 0x87 Address from Static Address target with a known Static Address Direct Set 0x88 SETNEWDA[1] Set New Dynamic Controller assigns a new Dynamic Address to any I3C Target Address GETPID[1] Get Provisional ID get the Target's Provisional-ID 0x8D Direct Get Get a Device's Bus Characteristic Register Direct Get 0x8E **GETBCR Get Bus Characteristics** Register (BCR) 0x8F Direct Get **GETDCR Get Device** Get a Device's Device Characteristic **Characteristics Register** Register (DCR) 0x90 Direct Get **GETSTATUS Get Device Status** Get Device's operating status 0x9A Direct **RSTACT Target Reset Action** Configure and query Target Reset action and timing

Table 10. Bus Characterization Register (BCR)

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

7.4.5 Examples of CCC protocol

7.4.5.1 ENEC/DISEC (Enable/Disable Target Events Command)

The ENEC/DISEC CCC allows the Controller to control when Target-initiated traffic is enabled or disabled on the I3C-bus. This control governs a Target's attempts to request an IBI (ENINT/DISINT), to request Controllership (ENMR/DISMR).

Table 11. Enable Target Events Command Byte Format

Bit	7	6	5	4	3	2	1	0
Symbol	reserved			ENHJ	reserved	ENMR	ENINT	

Table 12. Disable Target Events Command Byte Format

Bit	7	6	5	4	3	2	1	0
Symbol	reserved			DISHJ	reserved	DISMR	DISINT	

7.4.5.2 RSTDAA (Reset Dynamic Address Assignment)

The RSTDAA Broadcast CCC (Figure 6) indicates to all I3C Devices that the Controller requires them to clear/ reset their Controller-assigned Dynamic Address.

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

7.4.5.3 ENTDAA (Enter Dynamic Address Assignment)

The ENTDAA Broadcast CCC (Figure 7) indicates to all I3C Devices that the Controller requires them to enter the Dynamic Address Assignment procedure. Target Devices that already have a Dynamic Address assigned shall not respond to this command.

7.4.5.4 SETDASA (Set Dynamic Address from Static Address)

The SETDASA Direct CCC (Figure 8) allows the Controller to assign a Dynamic Address to one Target using the Target's Static Address. The SETDASA CCC should be used before the ENTDAA CCC is used.

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

7.4.5.5 SETNEWDA (Set New Dynamic Address)

The SETNEWDA Direct CCC (Figure 9) allows the I3C Controller to assign a new Dynamic Address to one I3C Target Device. In the Dynamic Address field, the 7 most significant bits (Bits[7:1]) contain the 7-bit Dynamic Address, and the least significant bit (Bit[0]) is filled with the value 1'b0.

7.4.5.6 GETPID (Get Provisioned ID)

The GETPID Direct CCC (Figure 10) is a Get request for one I3C Target Device to return its 48-bit Provisioned ID to the Controller. Following transmission of the GETPID CCC, the 48-bit value is transmitted as 6 bytes, with MSB first.

7.4.5.7 GETBCR (Get Bus Characteristics Register)

The GETBCR Direct CCC (Figure 11) is a Get request for one I3C Target Device to return its Bus Characteristics Register (BCR) to the Controller. The BCR value is transmitted in one byte, with the MSb transmitted first.

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

7.4.5.8 GETDCR (Get Device Characteristics Register)

The GETDCR Direct CCC (<u>Section 7.4.5.8</u>) is a Get request for one I3C Target Device to return its Device Characteristics Register (DCR) to the Controller. The DCR value is transmitted in one byte, with the MSB transmitted first.

7.4.5.9 GETSTATUS (Get Device Status)

The GETSTATUS Direct CCC (Figure 13) is a Get request for one I3C Target Device to return its current Status. It returns the two-byte format detailed in Table 13.

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

T	able 13.	GETSTATUS M	SB-LSB Format	

Vendor Reserved	Activity Mode	Protocol Error	Reserved	Pending Interrupt
BITS[15:8]	BITS[7:6]	BITS[5]	BITS[4]	BITS[3:0]
0	0	0	0	0

7.4.6 In-Band-Interrupt (IBI)

MIPI I3C supports interrupts from target devices to controllers through the SCL/SDA 2-wire interface. The targets wait for a quiet period in which both, SCL and SDA are idle and SDA is held high by a weak pull-up resistor.

At least one target can pull SDA low, so the controller is notified and starts SCL and enables the regular SDA pull-up resistor to enter address arbitration. The falling edge of SDA followed by a falling edge of SCL is then interpreted by all targets as a start condition.

One or more targets pulling SDA low through an open-drain driver release SDA on the falling SCL edge so it pulls up to high through the pull-up resistor.

During the following seven SCL pulses all eligible targets can transmit their dynamic address to the controller. The lowest dynamic address is recognized as the one with the highest priority. Once a target determines that another target is driving a lower address through its open drain output on SDA, it refrains from interfering with any further communication on SDA while the current communication continues.

The seven address bits are followed by RnW = 1 and an ACK driven by the controller (if acknowledged by the controller).

The following data byte is the mandatory data driven by the target in push-pull mode with SCL running up to HDR-SDR mode speed.

The P3T1035xUK/P3T2030xUK issues IBI when FH bit from 0 to 1 or FL bit from 0 to 1. (See Figure 14)

7.5 Register list

The P3T1035xUK/P3T2030xUK contains four data registers in addition to the pointer register. The pointer value, read/write capability, and default content at power-up of the registers are also shown in <u>Table 14</u>.

Register name	Pointer value	R/W	POR state	Description
Тетр	00h	read only	0000h	Temperature register: contains two 8-bit data bytes; stores the measured Temp data.
Conf	01h	R/W	02h	Configuration register: contains a single 8-bit data byte; sets the device operating condition; default = 0.
t _{LOW}	02h	R/W	F600h	t _{LOW} register (read/write), two 8-bit data bytes
t _{HIGH}	03h	R/W	3C00h	t _{HIGH} register (read/write), two 8-bit data bytes
MID	04h	read only	0236h	Manufacturer ID, two 8-bit data bytes

Table 14. Register table

7.5.1 Pointer register

The Pointer register contains an 8-bit data byte, of which the two LSB bits represent the pointer value of the other four registers, and the other six MSB bits are equal to 0, as shown in <u>Table 15</u> and <u>Table 16</u>. The Pointer register is not accessible to the user, but is used to select the data register for write/read operation by including the pointer data byte in the bus command.

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

Table 15. Pointer register

B7	B6	B5	B4	B3	B2	B[1:0]
0	0	0	0	0	0	pointer value

Table 16. Pointer value

B1	В0	Selected register
0	0	Temperature register (Temp, read only)
0	1	Configuration register (read/write)
1	0	t _{LOW} register (read/write)
1	1	t _{HIGH} register (read/write)

Because the Pointer value is latched into the Pointer register when the bus command (which includes the pointer byte) is executed, a read from the device may or may not include the pointer byte in the statement. To read again a register that has been recently read and the pointer has been preset, the pointer byte does not have to be included. To read a register that is different from the one that has been recently read, the pointer byte must be included. However, a write to the device must always include the pointer byte in the statement. The bus communication protocols are described in <u>Section 7.3</u>.

At power-up, the Pointer B[1:0] value is equal to 00b and the Temp register is selected; users can then read the Temp data without specifying the pointer byte.

Anything not shown in <u>Table 16</u> is reserved and should not be used.

7.5.2 Configuration register

The Configuration register (Conf) is a write/read register and contains an 8-bit non-complement data byte that is used to configure the device for different operation conditions. <u>Table 17</u> shows the bit assignments of this register.

D7	D6	D5	D4	D3	D2	D1	D0
ID	CR1	CR0	FH	FL	LC	M1	M0
0	0	0	0	0	0	1	0

 Table 17. Conf register and default value

7.5.2.1 Temperature watchdog flags (FH, FL and LC)

The P3T1035xUK/P3T2030xUK contains a watchdog function that monitors device temperature and compares the result to the values stored in the temperature limit registers (t_{HIGH} and t_{LOW}) to determine if the device temperature is within these set limits. If the temperature of the P3T1035xUK/P3T2030xUK becomes greater than the value in the t_{HIGH} register, then the flag-high bit (FH) in the configuration register is set to 1. If the temperature falls below the value in the t_{LOW} register, then the flag-low bit (FL) is set to 1. If both flag bits remain 0, then the temperature is within the temperature window set by the temperature limit registers (see Figure 14).

The latch bit (LC) in the configuration register is used to latch the value of the flag bits (FH and FL) until the controller issues a read command to the configuration register. The flag bits are set to 0 if a read command is received by the P3T1035xUK/P3T2030xUK, or if LC = 0 and the temperature is within the temperature limits. The power-on default values for these bits are FH = 0, FL = 0, and LC = 0.

In I3C, the P3T1035xUK/P3T2030xUK issues IBI when FH bit from 0 to 1 or FL bit from 0 to 1

7.5.2.2 Conversion rate (CR1 and CR0)

CR1 and CR0 are the conversion rate bits to configure the conversion rates of 0.25 Hz, 1 Hz, 4 Hz, or 8 Hz.

The default rate is 0.25 Hz. The typical conversion time is 7.8 ms. <u>Table 18</u> shows the settings for CR1 and CR0.

CR1		CONVERSION RATE			
0	0	.25 Hz (default)			
0	1	1 Hz			
1	0	4 Hz			
1	1	8 Hz			

Table 18.	Conversion	rate	settings
-----------	------------	------	----------

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

7.5.2.3 Temperature register

The Temperature register (Temp) holds the digital result of temperature measurement or monitor at the end of each analog-to-digital conversion. This register is read-only and contains two 8-bit data bytes consisting of one Most Significant Byte (MSByte) and one Least Significant Byte (LSByte). However, only 12 bits of those two bytes are used to store the Temp data in two's complement format with the resolution of 0.0625 °C. <u>Table 19</u> shows the bit arrangement of the Temp data in the data bytes.

Table 19. Temp register

Register	D7	D6	D5	D4	D3	D2	D1	D0
MSByte	T11	T10	Т9	Т8	Т7	Т6	Т5	T4
LSByte	Т3	T2	T1	т0	0	0	0	0

When reading register Temp, all 16 bits of the two data bytes (MSByte and LSByte) are provided to the bus and should be all collected by the controller for a valid temperature reading. However, only the 11 most significant bits should be used, and the four least significant bits of the LS Byte are zero and should be ignored. One of the ways to calculate the Temp value in °C from the 12-bit Temp data is:

To convert positive temperatures to a digital data format:

• Divide the temperature by the resolution. Then, convert the result to binary code with a 12-bit, left-justified format, and MSB = 0 to denote a positive sign.

Example: (+75 °C)/(0.0625 °C/count) = 1200 = 4B0h = 0100 1011 0000

To convert negative temperatures to a digital data format:

• Divide the absolute value of the temperature by the resolution, and convert the result to binary code with a 12-bit, left-justified format. Then, generate the two's complement of the result by complementing the binary number and adding one. Denote a negative number with MSB = 1.

Example: (|–25 °C|) / (0.0625 °C/count) = 400 = 190h = 0001 1001 0000. Two's complement format: 1110 0110 1111 + 1 = 1110 0111 0000

See <u>Table 20</u> for examples of the Temp data and values.

	ADC value

Table 20. Temp register values continued

7.5.3 High- and low-limit registers

P3T1035xUK/P3T2030xUK compares the temperature result with t_{HIGH} and t_{LOW} at the end of each temperature measurement.

If the temperature is greater than t_{HIGH}, the FH bit in the configuration register is set to 1. If the temperature is less than t_{LOW}, the FL bit in the configuration register is set to 1 (see Figure 14).

Table 21 and Table 22 describe the format of the tHIGH and tLOW registers. The Power-on reset value of tHIGH is 60 °C and t_{I OW} is -10 °C

Table 21. t _{HIGH} register								
Register	D7	D6	D5	D4	D3	D2	D1	D0
MSByte	H11	H10	H9	H8	H7	H6	H5	H4
LSByte	H3	H2	H1	HO	0	0	0	0

Table 22. t_{LOW} register

Register	D7	D6	D5	D4	D3	D2	D1	D0
MSByte	L11	L10	L9	L8	L7	L6	L5	L4
LSByte	L3	L2	L1	LO	0	0	0	0

7.6 Functional modes

There are three different modes: shutdown, one-shot, or continuous conversion, set by mode bits M0 and M1.

7.6.1 Shutdown mode (M1 = 0, M0 = 0)

In shutdown mode (M1 = 0, M0 = 0) all device circuitry shuts down other than the serial interface. It reduces current consumption to typically less than 0.5 µA. The device shuts down when current conversion is completed.

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

7.6.2 One-shot mode (M1 = 0, M0 = 1)

The P3T1035xUK/P3T2030xUK features a one-shot mode used for reducing power consumption when continuous temperature monitoring is not required.

To enable, the controller writes '01' to the M1 and M0 bits, which starts one-shot mode while the device is in shutdown mode, (i.e. a single temperature conversion). During the conversion, the M1 and M0 bits read 01. The device goes back to the shutdown state once the single conversion is completed. After the conversion, the M1 and M0 bits read 00.

Using one-shot mode, the device can have a higher conversion rate for fast temperature tracking or a lower conversion rate for power saving.

A complete one-shot period takes 20 ms (max), including active conversion and other processing time. The temperature registers are updated 20 ms (max) after a one-shot command is received. Reading the temperature registers takes place in less than 20 μ s.

To perform one-shot mode, the P3T1035xUK/P3T2030xUK must be in shutdown mode. If entering shutdown mode (i.e. writing a '00' to M1 and M0) from continuous conversion mode (M1=1), a 12 ms (max) delay is required to acknowledge the first one-shot command.

7.6.3 Continuous conversion mode (M1 = 1)

In continuous conversion mode (M1 = 1), the conversion rate bits (CR1 and CR0 in the configuration register) determine the conversion rate. The device finishes a single conversion then goes to standby and waits for the delay set by CR1 and CR0 bit. See <u>Table 23</u> for CR1 and CR0 settings.

CR1	CR0	Conversion rate (Hz)
0	0	0.25 (default)
0	1	1
1	0	4
1	1	8

Table 23. Conversion mode settings

7.7 Protocols for writing and reading the registers

The communication between the host and the device must strictly follow the rules as defined by the I^2 C-bus management. The protocols for device register read/write operations are illustrated in <u>Figure 16</u> to <u>Figure 22</u> together with the following definitions:

- 1. Before a communication, the I²C-bus must be free or not busy. It means that the SCL and SDA lines must both be released by all devices on the bus, and are pulled HIGH by the bus pull-up resistors.
- 2. The host must provide SCL clock pulses necessary for the communication. Data is transferred in a sequence of 9 SCL clock pulses for every 8-bit data byte followed by 1-bit status of the acknowledgement.
- 3. During data transfer, except the START and STOP signals, the SDA signal must be stable while the SCL signal is HIGH. It means that the SDA signal can be changed only during the LOW duration of the SCL line.
- 4. S: START signal, initiated by the host to start a communication, the SDA goes from HIGH to LOW while the SCL is HIGH.
- 5. RS: RE-START signal, same as the START signal, to start a read command that follows a write command.
- 6. P: STOP signal, generated by the host to stop a communication, the SDA goes from LOW to HIGH while the SCL is HIGH. The bus becomes free thereafter.
- 7. W: write bit, when the write/read bit = LOW in a write command.
- 8. R: read bit, when the write/read bit = HIGH in a read command.

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

- 9. A: device acknowledge bit, returned by the device. It is LOW if the device works properly and HIGH if not. The host must release the SDA line during this period in order to give the device the control on the SDA line.
- 10. A': controller acknowledge bit, not returned by the device, but set by the controller or host in reading 2-byte data. During this clock period, the host must set the SDA line to LOW in order to notify the device that the first byte has been read for the device to provide the second byte onto the bus.
- 11. NA: Not Acknowledge bit. During this clock period, both the device and host release the SDA line at the end of a data transfer, the host is then enabled to generate the STOP signal.
- 12. In a write protocol, data is sent from the host to the device and the host controls the SDA line, except during the clock period when the device sends the device acknowledgement signal to the bus.
- 13. In a read protocol, data is sent to the bus by the device and the host must release the SDA line during the time that the device is providing data onto the bus and controlling the SDA line, except during the clock period when the controller sends the controller acknowledgement signal to the bus.
- 14. For best temperature accuracy both temperature bytes should be read as shown in <u>Figure 20</u> and <u>Figure 21</u>, but for a quick less accurate check/reduce bus transmission then only one byte, the MSByte, needs to be read as shown in <u>Figure 18</u>.
- 15. The MDA (global Read/Write) format are shown in and Figure 22 and Figure 23

8 Application information

8.1 Typical application

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

8.2 Temperature accuracy

Because the local channel of the temperature sensor measures its own die temperature that is transferred from its body, the temperature of the device body must be stabilized and saturated for it to provide the stable readings. Because the device operates at a low-power level, the thermal gradient of the device package has a minor effect on the measurement. The accuracy of the measurement is more dependent upon the definition of the environment temperature, which is affected by different factors: the printed-circuit board on which the device is mounted, and the air flow contacting the device body. If the ambient air temperature and the printed-circuit board temperature are much different, then the measurement may not be stable because of the different thermal paths between the die and the environment. The stabilized temperature liquid of a thermal bath provides the best temperature environment when the device is fully submerged. A thermal probe with the device mounted inside a sealed-end metal tube located in consistent temperature air also provides a good method of temperature measurement.

8.3 Noise effect

The device design includes the implementation of basic features for good noise immunity:

- A 20 ns low-pass filter on both the bus pins SCL and SDA
- The hysteresis of the threshold voltages to the bus input signals SCL and SDA, about 200 mV minimum; good layout practices and extra noise filters are recommended when the device is used in a very noisy environment
- Use decoupling capacitors at V_{CC} pin
- Keep the digital traces away from switching power supplies
- · Apply proper terminations for the long board traces
- Add capacitors to the SCL and SDA lines to increase the low-pass filter characteristics.

8.4 POR and I3C Communication

To execute the power-on reset (POR) successfully and ensure normal operation, V_{CC} requires a starting voltage that is less than 300 mV. If this is violated, the device may remain in an indeterminate state that causes I²C/I3C communication failure.

15 Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

15.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

15.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- · The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- · Lead-free soldering versus SnPb soldering

15.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

15.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see <u>Figure 40</u>) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

• Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with <u>Table 32</u> and <u>Table 33</u>

Table 32. SnPb eutectic process (from J-STD-020D)

Package thickness (mm)	Package reflow temperature (°C)	
	Volume (mm³)	
	< 350	≥ 350
< 2.5	235	220
≥ 2.5	220	220

Table 33. Lead-free process (from J-STD-020D)

Package thickness (mm)	Package reflow temperature (°C)		
	Volume (mm ³)		
	< 350	350 to 2000	> 2000
< 1.6	260	260	260
1.6 to 2.5	260	250	245
> 2.5	250	245	245

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see Figure 40.

For further information on temperature profiles, refer to Application Note AN10365 "Surface mount reflow soldering description".

Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <u>https://www.nxp.com</u>.

Definitions

Draft — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at https://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

I3C, I²C-bus, 0.5 °C accuracy, digital temperature sensor

Quick reference data — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Suitability for use in non-automotive qualified products — Unless this document expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

HTML publications — An HTML version, if available, of this document is provided as a courtesy. Definitive information is contained in the applicable document in PDF format. If there is a discrepancy between the HTML document and the PDF document, the PDF document has priority.

Translations — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately. Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at <u>PSIRT@nxp.com</u>) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

 $\ensuremath{\mathsf{NXP}}\xspace$ B.V. — NXP B.V. is not an operating company and it does not distribute or sell products.
