

Using the UCC3895 in a Direct Control Driven Synchronous Rectifier Applications

User's Guide

Literature Number: SLUU109B
December 2001 – Revised February 2009

Using the UCC3895 in a Direct Control Driven Synchronous Rectifier Applications

1 Introduction

The UCC3895EVM-001 evaluation module (EVM) is an isolated 48-V input phase-shifted full-bridge converter providing an output of 3.3 V at 15 A. The AB outputs of the UCC3895, in this application are used for direct control driven synchronous rectification. No demodulation of the AB phase shift clock signals is necessary to produce fully operational synchronous rectification gate drive signals yielding a significant overall efficiency increase.

Operating in peak current-mode control, this EVM highlights the many benefits of using the UCC3895 advanced phase-shift PWM controller for direct control of synchronous rectification. This user's guide provides the schematic, component list, assembly drawing, artwork and test setup necessary to evaluate the UCC3895 in a typical control-driven synchronous rectification application.

2 Features

- 48-V typical input ($36\text{ V} < V_{IN} < 72\text{ V}$), 2:1 input range
- 3.3-V output at 15 A_{DC}
- Control driven synchronous rectifier current doubler output
- 1500-V input to output isolation
- Compact size, low profile (3.5" x 2.5" x 0.5")
- Peak current-mode control
- 400-kHz oscillator frequency (200-kHz operating frequency)
- Fixed-frequency operation
- 87% efficiency
- Single side OTS surface-mount components
- Short circuit protection

3 Description

The UCC3895EVM-001 EVM highlights the benefits of using the UCC3895 to implement direct control of a synchronous rectifier current-doubler output in a phase-shifted full bridge topology. The UCC3895 provides four 100-mA complementary outputs, labeled OUTA-OUTD, optimized to drive FET driver circuits. Two of the complementary outputs, OUTA and OUTB, are used to generate the drive signals necessary to switch the synchronous rectifiers. Since the UCC3895 controller is referenced to primary side ground, the OUTA and OUTB signals must first transition through a signal transformer before being fed into the secondary-side referenced UCC27424 dual 4-A MOSFET driver. This technique provides the proper gating and timing signals necessary to accurately synchronize the output switching to the primary-side bridge switching.

In addition to implementing synchronous rectification, designing a highly efficient phase shifted full bridge power converter is greatly dependant upon understanding the parasitic elements within the converter. This is necessary to optimize the resonant circuit responsible for achieving ZVS. The UCC3895 offers the added feature of adaptive delay set (ADS) and delay programming between complementary outputs. The ADS function serves to vary the delay time necessary, during the resonant transition period, as a function of load current. When more current is available to fully charge the equivalent resonant capacitance, less delay time is required, resulting in a longer effective duty cycle available for power transfer.

Further information regarding the details of ZVS resonant requirements and optimizing the UCC3895 PWM in a current doubler phase-shifted full-bridge topology are fully explained in references [1] - [3] and are not repeated here. As such, the scope of the following documentation shall focus primarily on configuring the UCC3895 for direct control driven synchronous rectification applications.

3.1 Schematic

A schematic of the UCC3895EVM-001 board is shown in [Figure 1](#). Terminal block J2 is the DC input voltage source connector. Terminal block J3 is the DC primary-side bias voltage, while terminal block J1 is the secondary output and return for the 3.3-V output.

The primary-side full-bridge power section is comprised of MOSFET's Q1-Q4. Because the converter switches at zero voltage, 8-pin SOIC packages were selected forgoing the use of large heatsinks typically found at this power level. Control of the full bridge is provided by U1, the UCC3895 and its accompanying circuitry. The four outputs of the UCC3895 are fed into two Texas Instruments UCC27200. The UCC27200 is a 3-A, 120-V high frequency high-diode/low-side driver which was chosen primarily because of the low impedance drive of 4 Ω . Primary power is efficiently transferred to the secondary across T1, a low profile planar transformer available from Payton.

Q5 and Q6 are the secondary-side synchronous rectifier MOSFET's shown with associated local gate discharge circuitry made up of D16, Q9, and D17, Q8. As mentioned previously, the control signals for Q5 and Q6 are derived directly from OUTA and OUTB of the UCC3895, greatly simplifying any timing issues typically met when designing isolated control driven synchronous power converters. To maintain isolation, OUTA and OUTB are fed through T3, a signal transformer. The output of T3 is then used as the input to U4, a UCC27424 dual 4-A MOSFET driver that directly drives the gates of Q5 and Q6. Passing OUTA and OUTB through T3 before U4 minimizes any leakage inductance current spike based on the fact that very little power is actually transferred through T3. In addition, a secondary side referenced bias voltage is generated from T3 and used to power U4, pin 6 (VDD).

The secondary to primary feedback path of the UCC3895EVM-001 is optically isolated via U3. The compensation network is located on the secondary side and is built around U5, a TL431 adjustable shunt regulator. This provides a low cost, simplified secondary referenced feedback solution with good noise immunity. Designing the UCC3895 for peak current mode control, allows a single pole (R33, C10), single zero (R33, C11) compensation network to be used. R41 and C14 are present to compensate for the inherent pole of the optocoupler. The feedback divider circuitry is set by R32 and R34, while the UCC3895 error amp (U1, pins 1 and 2) is set up in a voltage follower configuration.

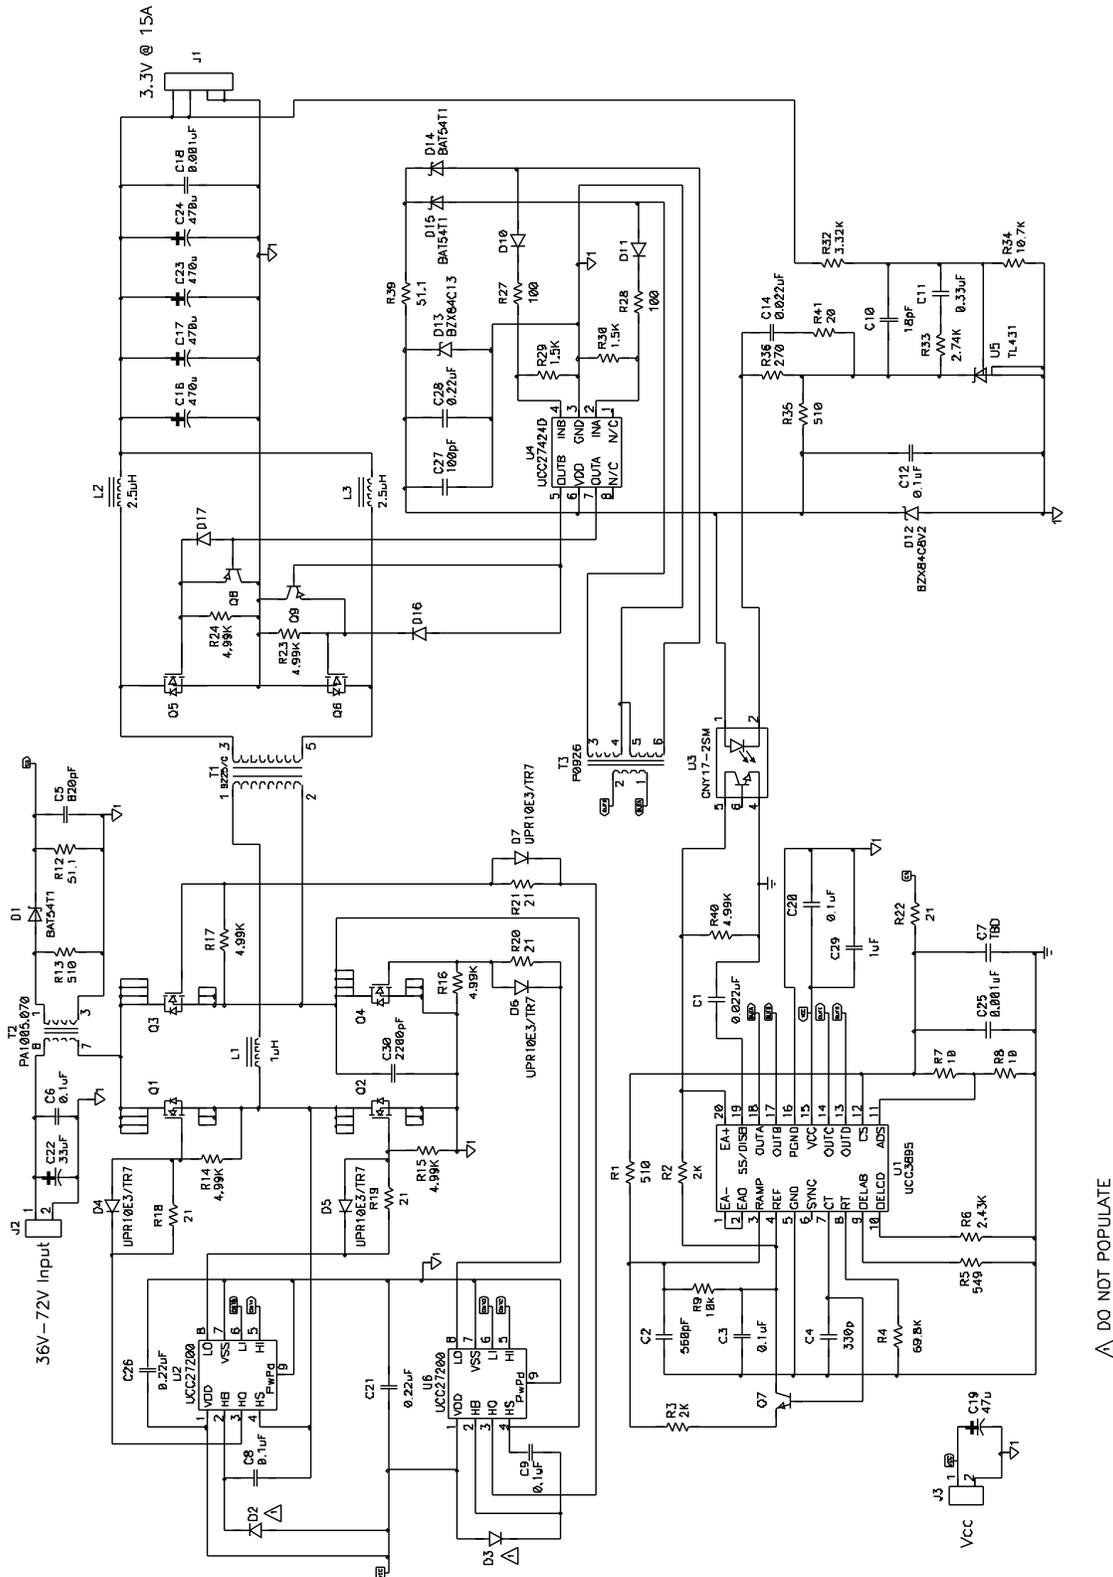

Figure 1. UCC3985EVM-001 Schematic

△ DO NOT POPULATE

3.2 Circuit Performance

The schematic shown in [Figure 1](#) was built and tested upon the printed circuit board (PCB) design shown in [Figure 10](#) through [Figure 14](#). For a detailed description of the list of materials used, refer to [Table 1](#).

3.3 UCC3895EVM-001 ZVS Measured Data

In addition to a significant increase in overall efficiency, one of the primary benefits of using synchronous rectifiers in a phase-shifted full bridge topology is to extend the useful load range for ZVS operation. While there is always the argument that ZVS may not be a concern at light load, due to the reduction in power dissipation, the objective of this design is to extend ZVS operation down to some minimum load less than that of the DM3895. One benefit of doing so would perhaps become more apparent from a systems point of view where electromagnetic interference (EMI) would be a concern. At the point where the converter crosses over from ZVS to traditional hard switching, a noticeable change in the EMI signature would be expected, which in the worst case might possibly result in a noncompliant system.

[Figure 2](#) and [Figure 3](#) show the MOSFET drain-to-source and gate-to-source waveforms of Q2 and Q4 for an input voltage of 48 V. Since Q2 and Q4 each have primary ground-referenced sources, they are convenient test points for obtaining ZVS waveforms. Q2 is the bottom MOSFET of the AB leg while Q4 corresponds to the CD leg. At an output load of 15 A, the drain voltage of each MOSFET completely falls to zero before the gate voltage starts to rise, clearly illustrating that each leg is switching at zero voltage.

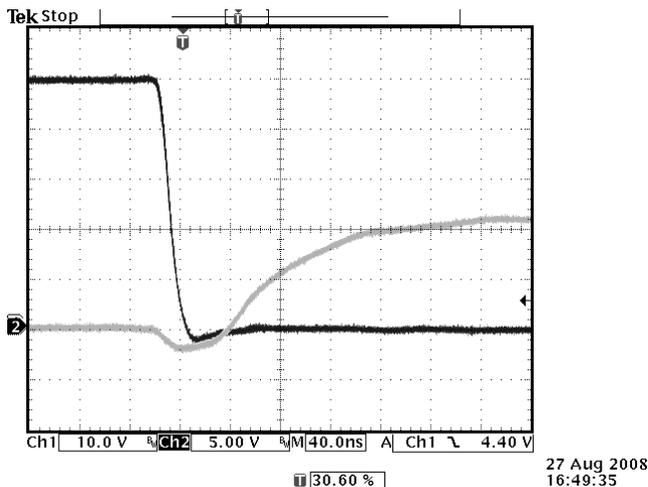

Figure 2. Q2 (AB Leg) at 15-A Load

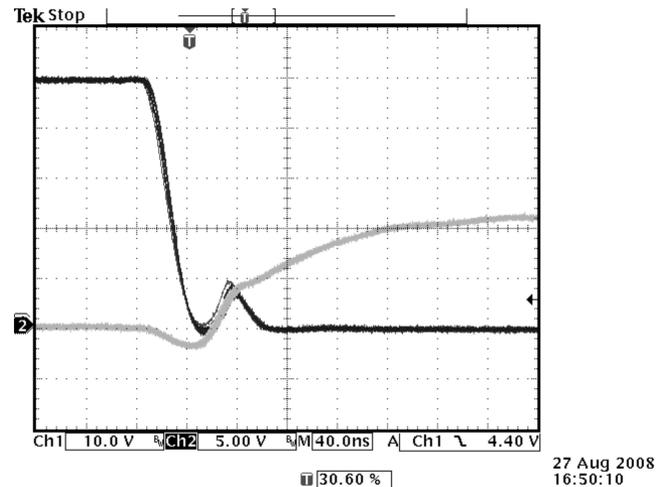

Figure 3. Q4 (CD Leg) at 15-A Load

More importantly, **Figure 4** and **Figure 5** show the same waveforms of Q2 and Q4, switching during an output load of 5.5 A. **Figure 4** shows that the drain voltage of Q2 still falls to zero, prior to the gate voltage starting to rise. However, the upward cusp shown on the drain voltage signal suggests that the stored resonant inductive energy is almost insufficient to drive the total resonant capacitance. ZVS is retained down to a minimum output load of 5.5 A in the AB leg, where the start of hard switching begins. Conversely, **Figure 5** illustrates that the CD leg is still switching at zero voltage at the same output load where ZVS is nearly lost in the AB leg.

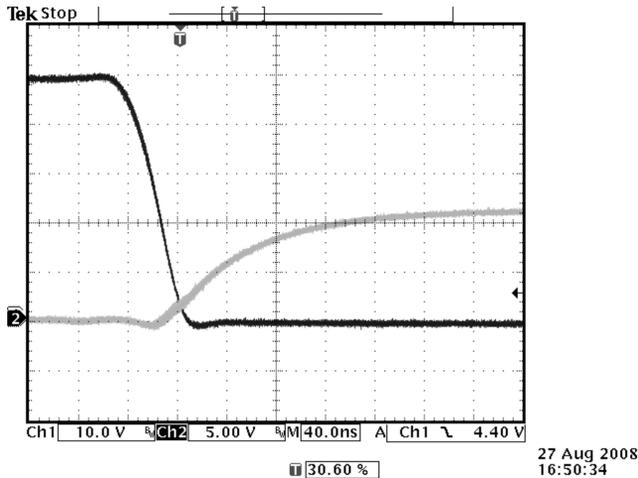

Figure 4. Q2 (AB Leg) at 5.5-A Load

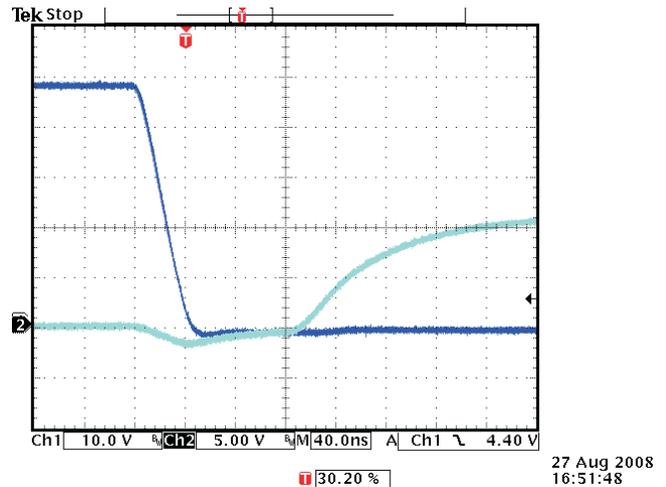

Figure 5. Q4 (CD Leg) at 5.5-A Load

At output loads less than 5.5 A, the UCC3895EVM-001 loses the benefits of ZVS in the AB leg, as the converter moves deeper into hard switching. The worst case of this is shown below in **Figure 6** where the gate of Q2 moves beyond $V_{GS(th)}$ while there is still significant voltage present on the drain when operating with no output load current. From **Figure 7** however, notice that the ZVS of the CD leg is retained all the way down to zero output load current. The switching details of how this is possible are fully explained in reference [1].

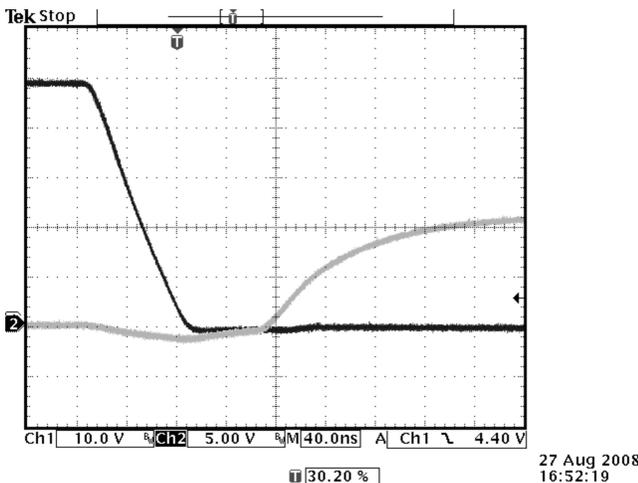

Figure 6. Q2 (AB Leg) at 0-A Load

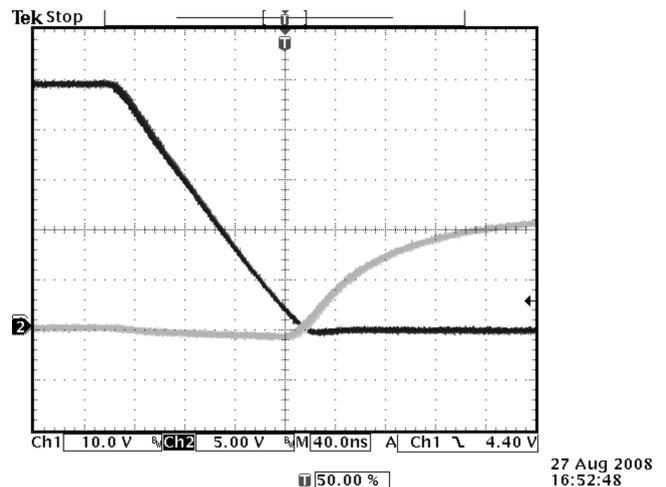

Figure 7. Q4 (CD Leg) at 0-A Load

At an output load current of 15 A, the UCC3895EVM-001 has an efficiency of approximately 85%, while the peak efficiency of just over 87% occurs between a load current of 7 A to 10 A. A plot of efficiency versus output power for an input voltage of 48 V is shown below in [Figure 8](#).

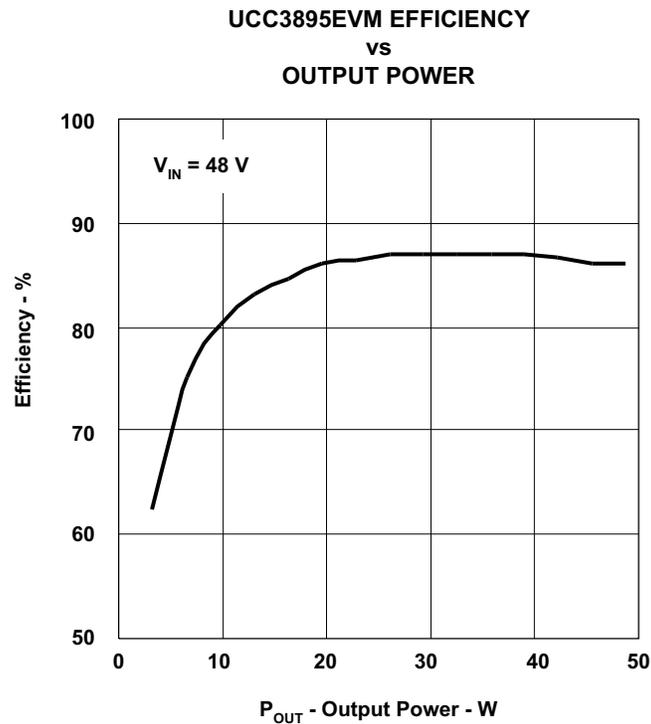

Figure 8.

4 Test Set Up

Shown below in [Figure 9](#) is the basic test setup needed to evaluate the UCC3895EVM-001. Please note the secondary ground (J1) is isolated from primary ground (J2, J3).

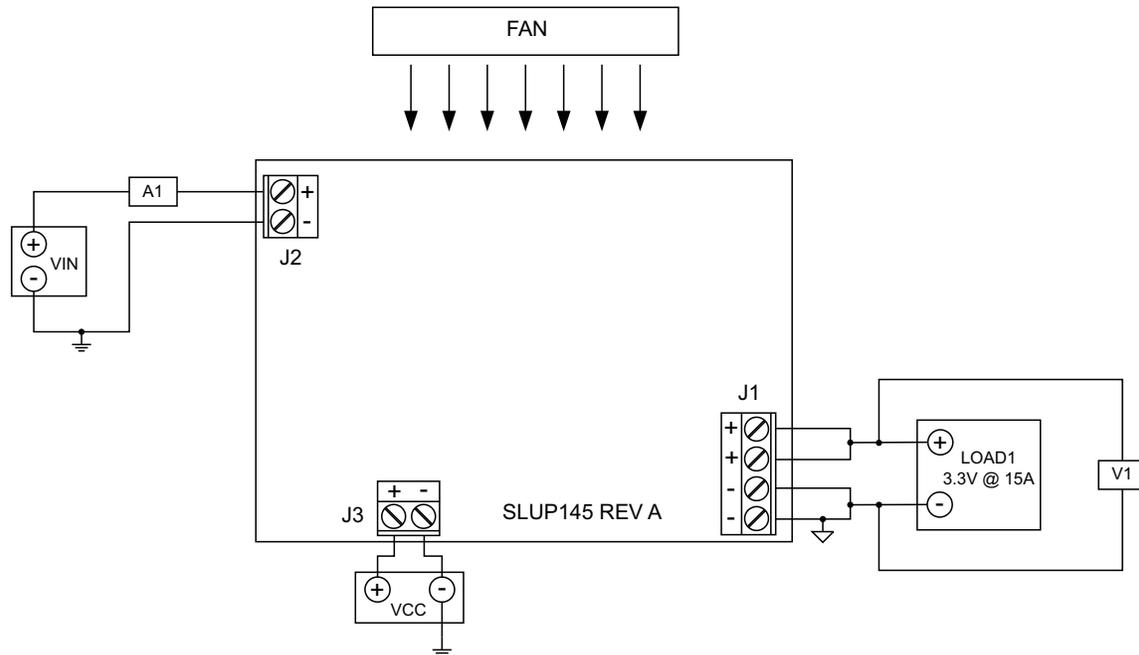

Figure 9. Recommended EVM Test Configuration

4.1 Output Load (LOAD1)

For the output load to VOUT, a programmable electronic load set to constant current mode and capable of sinking 0 -15 A_{DC}, is used. The UCC3895EVM-001 is ground isolated between the input and output. VIN and VCC are referenced to the primary side while VOUT is secondary side referenced. Refer to the EVM schematic of [Figure 1](#) and the test setup of [Figure 9](#). Using a DC voltmeter, V1, it is also advised to make all output voltage measurements directly at J1 terminals in order to minimize any voltage error experienced due to drops between J1 and the electronic load.

4.2 VCC DC Bias Supply (VCC)

The bias voltage supply is a variable DC source capable of supplying between 0 V_{DC} and 12 V_{DC} at no less than 0.25 A_{DC} and connected to J3 as shown in [Figure 9](#).

4.3 DC Input Source (VIN)

The input voltage should be a variable DC source capable of supplying between 0 V_{DC} and 72 V_{DC} at no less than 2 A_{DC}, and connected to J2 as shown in [Figure 9](#). For fault protection to the EVM, good common practice is to limit the source current to no more than 1.75 A_{DC}. A DC ammeter, A1 should also be inserted between VIN and J2 as shown in [Figure 9](#).

4.4 Fan

Most power converters include components that can get hot to the touch when approaching temperatures of 60°C. Because this EVM is not enclosed to allow probing of circuit nodes, a small fan capable of 20-30 cfm is recommended to reduce component temperatures when operating at full output load.

5 Power Up/Down Test Procedure

The following test procedure is recommended primarily for power up and shutting down the EVM. Whenever the EVM is running above an output load of 10 A, the fan should be turned on. Also, never walk away from a powered EVM for extended periods of time.

1. Working at an ESD workstation, make sure that any wrist straps, boot straps or mats are connected referencing the user to earth ground before power is applied to the EVM. Electrostatic smock and safety glasses should also be worn.
2. Connect VCC to J3 as shown in [Figure 9](#). Make sure that VCC is initially set to 0 V.
3. Prior to connecting the DC input source, VIN, it is advisable to limit the source current from VIN to 1.75 A maximum. Connect the ammeter A1 (0-1.5 A range) between VIN and J2 as shown in [Figure 9](#). Make sure VIN is initially set to 0 V.
4. Connect LOAD1 and the voltmeter, V1 to J1 as shown in [Figure 9](#). Set LOAD1 to constant current mode to sink 0 A_{DC} before VIN and VCC are applied.
5. Increase VCC from 0 V_{DC} to 12 V_{DC} (overcome UVLO threshold) and then set to 10.5 V_{DC}. With VCC applied, the control and switching circuitry can now be checked from the UCC3895 outputs to the gates of the bridge MOSFETS, Q1-Q4 and synchronous MOSFETS, Q5 and Q6.
6. Increase VIN from 0 V to 48 V_{DC}, while monitoring the output voltage on V1.
7. Vary LOAD1 anywhere between 0 A to 15 A_{DC}, making sure to turn on fan blowing air directly on the EVM for loads above 10 A.
8. Vary the input voltage between 36 V and 72 V.
9. Shut down the electronic load.
10. Shut down VIN.
11. Shut down VCC.

6 EVM Assembly Drawing and Layout

Figure 10 shows the top-side component placement for the EVM, as well as pin numbers and component polarity where necessary. A four layer PCB was designed using the top and bottom layers for signal traces and an internal split ground plane tied to a single point at C22. The PCB dimensions are 3.5" x 2.5" with a design goal of maintaining all components to less than 0.5" high measured from the top layer surface. All components are standard OTS surface-mount components placed on the top side of the PCB only. The copper etch, looking through the top of the PCB, for each layer is also shown in Figure 11 through Figure 14.

EVALUATION BOARD/KIT IMPORTANT NOTICE

Texas Instruments (TI) provides the enclosed product(s) under the following conditions:

This evaluation board/kit is intended for use for **ENGINEERING DEVELOPMENT, DEMONSTRATION, OR EVALUATION PURPOSES ONLY** and is not considered by TI to be a finished end-product fit for general consumer use. Persons handling the product(s) must have electronics training and observe good engineering practice standards. As such, the goods being provided are not intended to be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including product safety and environmental measures typically found in end products that incorporate such semiconductor components or circuit boards. This evaluation board/kit does not fall within the scope of the European Union directives regarding electromagnetic compatibility, restricted substances (RoHS), recycling (WEEE), FCC, CE or UL, and therefore may not meet the technical requirements of these directives or other related directives.

Should this evaluation board/kit not meet the specifications indicated in the User's Guide, the board/kit may be returned within 30 days from the date of delivery for a full refund. **THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE.**

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user indemnifies TI from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge.

EXCEPT TO THE EXTENT OF THE INDEMNITY SET FORTH ABOVE, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

TI currently deals with a variety of customers for products, and therefore our arrangement with the user **is not exclusive.**

TI assumes **no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein.**

Please read the User's Guide and, specifically, the Warnings and Restrictions notice in the User's Guide prior to handling the product. This notice contains important safety information about temperatures and voltages. For additional information on TI's environmental and/or safety programs, please contact the TI application engineer or visit www.ti.com/esh.

No license is granted under any patent right or other intellectual property right of TI covering or relating to any machine, process, or combination in which such TI products or services might be or are used.

FCC Warning

This evaluation board/kit is intended for use for **ENGINEERING DEVELOPMENT, DEMONSTRATION, OR EVALUATION PURPOSES ONLY** and is not considered by TI to be a finished end-product fit for general consumer use. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

EVM WARNINGS AND RESTRICTIONS

It is important to operate this EVM within the input voltage range of 36 V to 72 V and the output voltage range of 0V to 3.3 V as supplied.

Exceeding the specified input range may cause unexpected operation and/or irreversible damage to the EVM. If there are questions concerning the input range, please contact a TI field representative prior to connecting the input power.

Applying loads outside of the specified output range may result in unintended operation and/or possible permanent damage to the EVM. Please consult the EVM User's Guide prior to connecting any load to the EVM output. If there is uncertainty as to the load specification, please contact a TI field representative.

During normal operation, some circuit components may have case temperatures greater than 85°C. The EVM is designed to operate properly with certain components above as long as the input and output ranges are maintained. These components include but are not limited to linear regulators, switching transistors, pass transistors, and current sense resistors. These types of devices can be identified using the EVM schematic located in the EVM User's Guide. When placing measurement probes near these devices during operation, please be aware that these devices may be very warm to the touch.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
