1 Introduction

The TPS54428 is a single, adaptive on-time, D-CAP2™-mode, synchronous buck converter requiring a low, external component count. The D-CAP2 control circuit is optimized for low-ESR output capacitors such as POSCAP, SP-CAP, or ceramic types and features fast transient response with no external compensation. The switching frequency is internally set at a nominal 650 kHz. The high-side and low-side switching MOSFETs are incorporated inside the TPS54428 package along with the gate drive circuitry. The low drain-to-source on resistance of the MOSFETs allows the TPS54428 to achieve high efficiencies and helps keep the junction temperature low at high-output currents. The TPS54428 also features auto-skip Eco-mode operation for improved light-load efficiency. The TPS54428 dc/dc synchronous converter is designed to provide up to a 4 A output from an input voltage source of 4.5 V to 18 V. The output voltage range is from 0.76 V to 6 V. Rated input voltage and output current range for the evaluation module are given in [Table 1-1](#).

The TPS54428EVM-052 evaluation module is a single, synchronous buck converter providing 1.05 V at 4 A from 4.5-V to 18-V input. This user's guide describes the TPS54428EVM-052 performance.

3 Modifications

This evaluation module is designed to provide access to the features of the TPS54428. Some modifications can be made to this module.

3.1 Output Voltage Setpoint

To change the output voltage of the EVM, it is necessary to change the value of resistor R1. Changing the value of R1 can change the output voltage above 0.765 V. The value of R1 for a specific output voltage can be calculated using [Equation 1](#).

For output voltages from 0.76 V to 7 V:

$$V_{OUT} = 0.765V \cdot \left(1 + \frac{R1}{R2}\right) \quad (1)$$

[Table 3-1](#) lists the R1 values for some common output voltages. For higher output voltages of 1.8 V or above, a feedforward capacitor (C4) may be required to improve phase margin. Pads for this component (C4) are provided on the printed-circuit board. Note that the resistor values given in [Table 3-1](#) are standard values and not the exact value calculated using [Equation 1](#).

OUTPUT VOLTAGE (V)	R1 (kΩ)	R2 (kΩ)	C4 (pF)	L1 (μH)	C9, C10, C11 TOTAL CAPACITANCE (μF)

3.2 Output Filter and Closed-Loop Response

The TPS54428 relies on the output filter characteristics to ensure stability of the control loop. The recommended output filter components for common output voltages are given in [Table 3-1](#). It may be possible for other output filter component values to provide acceptable closed-loop characteristics. R3 and TP4 are provided for convenience in breaking the control loop and measuring the closed-loop response.

4 Test Setup and Results

This section describes how to properly connect, set up, and use the TPS54428EVM-052. It also includes test results typical for the evaluation module like efficiency, output load regulation, output line regulation, load transient response, output voltage ripple, input voltage ripple, start-up, shut-down, and switching frequency.

4.1 Input/Output Connections

Table 4-1 shows the input/output connectors and test points of TPS54428EVM-052. Connect a power supply capable of supplying 2 A to J1 through a pair of 20 AWG wires. Connect the load to J2 through a pair of 20 AWG wires. The maximum load current capability is 4 A. Minimize wire lengths to reduce losses in the wires. Test point TP1 provides a place to monitor the input voltages (V_{IN}) with TP2 providing a convenient ground reference. Use TP8 to monitor the output voltage with TP9 as the ground reference.

5.1 Layout

The board layout for the TPS54428EVM-052 is shown in [Figure 5-1](#) through [Figure 5-5](#). The top layer contains the main power traces for VIN, VO, and ground. Also on the top layer are connections for the pins of the TPS54428 and a large area filled with ground. Many of the signal traces also are located on the top side. The input decoupling capacitors are located as close to the IC as possible. The input and output connectors, test points, and all of the components are located on the top side. An analog ground (GND) area is provided on the top side. Analog ground (GND) and power ground (PGND) are connected at a single point on the top layer near C6. The bottom layer is primarily power ground but also has a trace to connect VIN to the enable jumper, a trace to connect VREG5 to TP5, and the feedback trace from VOUT to the voltage setpoint divider network.
